## DESCRIPTION

# PESTICIDAL TOXINS

#### Cross-Reference to a Related Application

This application is a continuation-in-part of Application Serial No. 08/633,993, filed April 19, 1996.

# Background of the Invention

5

10

15

The soil microbe Bacillus thuringiensis (B.t.) is a Gram-positive, spore-forming bacterium characterized by parasporal crystalline protein inclusions. These inclusions often appear microscopically as distinctively shaped crystals. The proteins can be highly toxic to pests and specific in their toxic activity. Certain B.t. toxin genes have been isolated and sequenced. and recombinant DNA-based B.t. products have been produced and approved for use. In addition, with the use of genetic engineering techniques, new approaches for delivering these B.t. endotoxins to agricultural environments are under development, including the use of plants genetically engineered with endotoxin genes for insect resistance and the use of stabilized intact microbial cells as B.t. endotoxin delivery vehicles (Gaertner, F.H., L. Kim [1988] TIBTECH 6:S4-S7). Thus, isolated B.t. endotoxin genes are becoming commercially valuable.

20

Until the last ten years, commercial use of B.t. pesticides has been largely restricted to a narrow range of lepidopteran (caterpillar) pests. Preparations of the spores and crystals of B. thuringiensis subsp. kurstaki have been used for many years as commercial insecticides for lepidopteran pests. For example, B. thuringiensis var, kurstaki HD-1 produces a crystalline δendotoxin which is toxic to the larvae of a number of lepidopteran insects.

25

30

In recent years, however, investigators have discovered B.t. pesticides with specificities for a much broader range of pests. For example, other species of B.t., namely israelensis and tenebrionis (a.k.a. B.t. M-7, a.k.a. B.t. san diego), have been used commercially to control insects of the orders Diptera and Coleoptera, respectively (Gaertner, F.H. [1989] "Cellular Delivery Systems for Insecticidal Proteins: Living and Non-Living Microorganisms," in Controlled Delivery of Crop Protection Agents, R.M. Wilkins, ed., Taylor and Francis, New York and London, 1990, pp. 245-255). See also Couch, T.L. (1980) "Mosquito Pathogenicity of Bacillus thuringiensis var. israelensis," Developments in Industrial Microbiology 22:61-76; Beegle, C.C., (1978) "Use of Entomogenous Bacteria in Agroecosystems," Developments in Industrial Microbiology 20:97-104. Krieg, A., A.M. Huger, G.A. Langenbruch, W. Schnetter

10

15

20

25

30

(1983) Z. ang. Ent. 96:500-508, describe Bacillus thuringiensis var. tenebrionis, which is reportedly active against two beetles in the order Coleoptera. These are the Colorado potato beetle, Leptinotarsa decemlineata, and Agelastica alni.

Recently, new subspecies of B.t. have been identified, and genes responsible for active ô-endotoxin proteins have been isolated (Höfle, H., H.R. Whiteley [1989] Microbiological Reviews 52(2):242-255). Höfle and Whiteley classified B.t. crystal protein genes into 4 major classes. The classes were Cryl (Lepidoptera-specific), Cryll (Lepidoptera- and Diptera-specific), Cryll (Coleoptera-specific), and CrylV (Diptera-specific). The discovery of strains specifically toxic to other pests has been reported. (Feitelson, J.S., J. Payne, L. Kim [1992] Bio/Technology 10:271-275).

The cloning and expression of a B.t. crystal protein gene in Escherichia coli has been described in the published literature (Schnepf, H.E., H.R. Whiteley [1981] Proc. Natl. Acad. Sci. USA 78:2893-2897). U.S. Patent 4,448,885 and U.S. Patent 4,467,036 both disclose the expression of B.t. crystal protein in E. coli. U.S. Patents 4,797,276 and 4,853,331 disclose B. thuringiensis strain temebrionis (a.k.a. M-7, a.k.a. B.t. san diego) which can be used to control coleopteran pests in various environments. U.S. Patent No. 4,918,006 discloses B.t. toxins having activity against Dipterans. U.S. Patent No. 4,849,217 discloses B.t. isolates which have activity against the alfalfa weevil. U.S. Patent No. 5,208,077 discloses coleopteran-active Bacillus thuringiensis isolates. U.S. Patent No. 5,151,363 and U.S. Patent No. 4,948,734 disclose certain isolates of B.t. which have activity against nematodes. As a result of extensive research and investment of resources, other patents have issued for new B.t. isolates and new uses of B.t. isolates. However, the discovery of new B.t. isolates and new uses of known B.t. isolates remains an empirical, unpredictable art.

Coleopterans are an important group of agricultural pests which cause a very large amount of damage each year. Examples of coleopteran pests include alfalfa weevils and corn rootworm.

The alfalfa weevil, Hypera postica, and the closely related Egyptian alfalfa weevil, Hypera brunneipennis, are the most important insect pests of alfalfa grown in the United States, with 2.9 million acres infested in 1984. An annual sum of 20 million dollars is spent to control these pests. The Egyptian alfalfa weevil is the predominant species in the southwestern U.S., where it undergoes aestivation (i.e., hibernation) during the hot summer months. In all other respects, it is identical to the alfalfa weevil, which predominates throughout the rest of the U.S.

The larval stage is the most damaging in the weevil life cycle. By feeding at the alfalfa plant's growing tips, the larvae cause skeletonization of leaves, stunting, reduced plant growth,

and, ultimately, reductions in yield. Severe infestations can ruin an entire cutting of hay. The adults, also foliar feeders, cause additional, but less significant, damage.

Approximately 9.3 million acres of U.S. com are infested with com rootworm species complex each year. The com rootworm species complex includes the northern com rootworm, Diabrotica barberi, the southern com rootworm, D. undecimpunctata howardi, and the western com rootworm, D. virgifera virgifera. The soil-dwelling larvae of these Diabrotica species feed on the root of the com plant, causing lodging. Lodging eventually reduces corn yield and often results in death of the plant. By feeding on cornsilks, the adult beetles reduce pollination and, therefore, detrimentally effect the yield of corn per plant. In addition, adults and larvae of the genus Diabrotica attack cucurbit crops (cucumbers, melons, squash, etc.) and many vegetable and field crops in commercial production as well as those being grown in home gardens.

Control of corn rootworm has been partially addressed by cultivation methods, such as crop rotation and the application of high nitrogen levels to stimulate the growth of an adventitious root system. However, chemical insecticides are relied upon most heavily to guarantee the desired level of control. Insecticides are either banded onto or incorporated into the soil. The major problem associated with the use of chemical insecticides is the development of resistance among the treated insect populations.

#### Brief Summary of the Invention

The subject invention concerns novel materials and methods for controlling nonmammalian pests. In a preferred embodiment, the subject invention provides materials and methods for the control of coleopteran pests. In specific embodiments, the materials and methods described herein are used to control alfalfa weevil and/or corn rootworm.

The subject invention advantageously provides two new classes of polynucleotide sequences which encode corresponding novel classes of pesticidal proteins. One novel class of polynucleotide sequences as described herein encodes toxins which have a full-length molecular weight of approximately 40-50 kDa. In a specific embodiment, these toxins have a molecular weight of about 43-47 kDa. A second class of polynucleotides, which encodes pesticidal proteins of about 10-15 kDa, is also provided according to the subject invention. In a specific embodiment, these toxins have a molecular weight of about 13-14 kDa. The subject invention concerns polynucleotides which encode which encode the 40-50 kDa and 10-15 kDa toxins, polynucleotides which encode pesticidal fragments of the full length toxins, and polynucleotide sequences which encode pesticidal fragments of the full length toxins, and polynucleotide sequences which encode lenger forms of these toxins which include, for example, a motoxin region. In a

5

10

15

20

preferred embodiment, these toxins, including the fragments, are active against coleopteran pests.

Specific B.t. toxins useful according to the invention include toxins which can be obtained from the B.t. isolates designated as PS80JII, PS149B1, and PS167H2. Of these, PS149B1 and PS167H2 are novel isolates. The subject invention also includes the use of variants of the exemplified B.t. isolates and toxins which have substantially the same coleopteran-active properties as the specifically exemplified B.t. isolates and toxins. Such variant isolates would include, for example, mutants. Procedures for making mutants are well known in the microbiological art. Ultraviolet light and chemical mutagens such as nitrosoguanidine are used extensively toward this end.

In one embodiment of the subject invention, the polynucleotide sequences of the subject invention are used to encode toxins of approximately 43-47 kDa. These toxins are then used to control coleopteran pests. In a particularly preferred embodiment, the coleopteran pests are com rootworms. The genes which encode the 43-47 kDa toxins can be obtained from, for example, PS80JJI, PS149B1, or PS167H2. In a second embodiment, toxins of approximately 13-14 kDa are used to control coleopteran pests. The approximately 13-14 kDa toxin, as well as the genes which encode these toxins, can also be obtained from PS80JJI, PS149B1, or PS167H2. In a particularly preferred embodiment, the activity of the 43-47 kDa toxins can be augmented and/or facilitated by further contacting the target pests with an approximately 13-14 kDa toxin.

In a preferred embodiment, the subject invention concerns plants cells transformed with at least one polynucleotide sequence of the subject invention such that the transformed plant cells express pesticidal toxins in tissues consumed by the target pests.

Alternatively, the B.t. isolates of the subject invention, or recombinant microbes expressing the toxins described herein, can be used to control pests. In this regard, the invention includes the treatment of substantially intact B.t. cells, and/or recombinant cells containing the expressed toxins of the invention, treated to prolong the pesticidal activity when the substantially intact cells are applied to the environment of a target pest. The treated cell acts as a protective coating for the pesticidal toxin. The toxin becomes active upon ingestion by a target insect.

#### Brief Description of the Drawings

Figure 1 shows three specific 43-47 kDa pesticidal toxins of the subject invention as well as a consensus sequence for these pesticidal toxins.

Figure 2 shows the relationship of the 14 and 45 kDa sequences of PS80JJ1 (SEQ ID NOS, 31 and 10).

### Brief Description of the Sequences

SEQ ID NO. 1 is a 5-amino acid N-terminal sequence of the approximately 45 kDa toxin of 80III.

SEQ ID NO. 2 is a 25-amino acid N-terminal sequence of the approximately 45 kDa toxin of 80JJ1.

SEQ ID NO. 3 is a 24-amino acid N-terminal sequence of the approximately 14 kDa toxin of 80JJ1.

SEQ ID NO. 4 is the N-terminal sequence of the approximately 47 kDa toxin from 149B1.

SEQ ID NO. 5 is a 50-amino acid N-terminal amino acid sequence for the purified approximately 14 kDa protein from PS149B1.

SEQ ID NO. 6 is the N-terminal sequence of the approximately 47 kDa toxin from 167H2.

SEQ ID NO. 7 is a 25-amino acid N-terminal sequence for the purified approximately 14 kDa protein from PS167H2.

SEQ ID NO. 8 is an oligonucleotide probe for the gene encoding the PS80JJI 44.3 kDa toxin and is a forward primer for PS149B1 and PS167H2 used according to the subject invention.

SEQ ID NO. 9 is a reverse primer for PS149B1 and PS167H2 used according to the subject invention.

SEQ ID NO. 10 is the nucleotide sequence of the gene encoding the approximately 45 kDa PS80JJ1 toxin.

SEQ ID NO. 11 is the amino acid sequence for the approximately 45 kDa PS80JJ1 toxin.

SEQ ID NO. 12 is the partial nucleotide sequence of the gene encoding the approximately 44 kDa PS149B1 toxin.

SEQ ID NO. 13 is the partial amino acid sequence for the approximately 44 kDa PS149R1 toxin.

SEQ ID NO. 14 is the partial nucleotide sequence of the gene encoding the approximately 44 kDa PS167H2 toxin.

SEQ ID NO. 15 is the partial amino acid sequence for the approximately 44 kDa PS167H2 toxin.

SEQ ID NO. 16 is a peptide sequence used in primer design according to the subject invention.

- SEQ ID NO. 17 is a peptide sequence used in primer design according to the subject invention.
- SEQ ID NO. 18 is a peptide sequence used in primer design according to the subject invention.
- SEQ ID NO. 19 is a peptide sequence used in primer design according to the subject invention.
  - SEQ ID NO. 20 is a nucleotide sequence corresponding to the peptide of SEQ ID NO.

16.

SEQ ID NO. 21 is a nucleotide sequence corresponding to the peptide of SEQ ID NO.

17.

5

10

15

20

25

30

SEQ ID NO. 22 is a nucleotide sequence corresponding to the peptide of SEQ ID NO.

18.

SEQ ID NO. 23 is a nucleotide sequence corresponding to the peptide of SEQ ID NO.

19.

SEQ ID NO. 24 is a reverse primer based on the reverse complement of SEQ ID NO.

22.

 $\boldsymbol{SEQ}$  ID NO. 25 is a reverse primer based on the reverse complement of SEQ ID NO.

23.

- SEO ID NO. 26 is a forward primer based on the PS80JJ1 44.3 kDa toxin.
- SEO ID NO. 27 is a reverse primer based on the PS80JJ1 44.3 kDa toxin.
- SEQ ID NO. 28 is a generic sequence representing a new class of toxins according to the subject invention.
  - SEO ID NO. 29 is an oligonucleotide probe used according to the subject invention.
- SEQ ID NO. 30 is the nucleotide sequence of the entire genetic locus containing open reading frames of both the 14 and 45 kDa PS80JJ1 toxins and the flanking nucleotide sequences.
- SEQ ID NO. 31 is the nucleotide sequence of the PS80JJ1 14 kDa toxin open reading frame.
  - SEQ ID NO. 32 is the deduced amino acid sequence of the 14 kDa toxin of PS80JJ1.
- SEQ ID NO. 33 is a reverse oligonucleotide primer used according to the subject invention.
- SEQ ID NO. 34 is the nucleotide sequence of the entire genetic locus containing open reading frames of both the 14 and 44 kDa PS167H2 toxins and the flanking nucleotide sequences.

10

15

20

25

30

SEQ ID NO. 35 is the nucleotide sequence of the gene encoding the approximately 14 kDa PS167H2 toxin.

SEQ ID NO. 36 is the amino acid sequence for the approximately 14 kDa PS167H2 toxin.

SEQ ID NO. 37 is the nucleotide sequence of the gene encoding the approximately 44 kDa PS167H2 toxin.

SEQ ID NO. 38 is the amino acid sequence for the approximately 44 kDa PS167H2 toxin.

SEQ ID NO. 39 is the nucleotide sequence of the entire genetic locus containing open reading frames of both the 14 and 44 kDa PS149B1 toxins and the flanking nucleotide sequences.

SEQ ID NO. 40 is the nucleotide sequence of the gene encoding the approximately 14 kDa PS149B1 toxin.

SEQ ID NO. 41 is the amino acid sequence for the approximately 14 kDa PS149B1

toxin.

SEQ ID NO. 42 is the nucleotide sequence of the gene encoding the approximately 44 kDa PS149B1 toxin.

SEQ ID NO. 43 is the amino acid sequence for the approximately 44 kDa PS149B1 toxin.

SEQ ID NO. 44 is a maize-optimized gene sequence encoding the approximately 14 kDa toxin of 80JJ1.

SEQ ID NO. 45 is a maize-optimized gene sequence encoding the approximately 44 kDa toxin of 80JJ1.

#### Detailed Disclosure of the Invention

The subject invention concerns two new classes of polynucleotide sequences which encode novel pesticidal toxins. In one embodiment, the toxins have a full-length molecular weight of approximately 40-50 kDa. In specific embodiments exemplified herein, these toxins have a molecular weight of about 43-7 kDa. In a second embodiment, the pesticidal toxins have a molecular weight of approximately 10-15 kDa. In specific embodiments exemplified herein, these toxins have a molecular weight of about 13-14 kDa. Certain specific toxins are exemplified herein. For toxins having a known amino acid sequence, the molecular weight is also known. Those skilled in the art will recognize that the apparent molecular weight of a protein as determined by gel electrophoresis will sometimes differ from the true molecular.

weight. Therefore, reference herein to, for example, a 45 kDa protein or a 14 kDa protein is understood to refer to proteins of approximately that size even if the true molecular weight is somewhat different.

The subject invention concerns not only the polynucleotide sequences which encode these classes of toxins, but also the use of these polynucleotide sequences to produce recombinant hosts which express the toxins. In a further aspect, the subject invention concerns the combined use of an approximately 40-50 kDa toxin of the subject invention together with an approximately 10-15 kDa toxin of the subject invention to achieve highly effective control of pests, including coleopterans such as corn rootworm.

A further aspect of the subject invention concerns two novel isolates and the toxins and genes obtainable from these isolates. The novel B.t. isolates of the subject invention have been designated PS149B1 and PS167H2.

The new classes of toxins and polynucleotide sequences provided here are defined according to several parameters. One critical characteristic of the toxins described herein is pesticidal activity. In a specific embodiment, these toxins have activity against coleopteran pests. The toxins and genes of the subject invention can be further defined by their amino acid and nucleotide sequences. The sequences of the molecules within each novel class can be defined herein in terms of homology to certain exemplified sequences as well as in terms of the ability to hybridize with, or be amplified by, certain exemplified probes and primers. The classes of toxins provided herein can also be identified based on their immunoreactivity with certain antibodies and based upon their adherence to a generic formula.

The sequence of three approximately 45 kDa toxins of the subject invention are provided as SEQ ID NOS. 11, 43, and 38. In a preferred embodiment of the subject invention, the toxins in this new class have a sequence which conforms to the generic sequence presented as SEQ ID NO. 28. In a specific embodiment, the toxins of this class will conform to the consensus sequence shown in Figure 1.

In a preferred embodiment, the toxins of the subject invention have at least one of the following characteristics:

(a) said toxin is encoded by a nucleotide sequence which hybridizes under stringent conditions with a nucleotide sequence selected from the group consisting of: DNA which encodes SEQ ID NO. 2, DNA which encodes SEQ ID NO. 4, DNA which encodes SEQ ID NO. 6, SEQ ID NO. 8, SEQ ID NO. 10, DNA which encodes SEQ ID NO. 11, SEQ ID NO. 12, DNA which encodes SEQ ID NO. 13, SEO ID NO. 14, DNA which encodes SEQ ID NO. 15, DNA which encodes

5

10

15

20

10

15

20

25

SEQ ID NO. 16, DNA which encodes SEQ ID NO. 17, DNA which encodes SEQ ID NO. 18, DNA which encodes SEQ ID NO. 19, SEQ ID NO. 20, SEQ ID NO. 21, SEQ ID NO. 22, SEQ ID NO. 23, SEQ ID NO. 24, SEQ ID NO. 25, SEQ ID NO. 26, SEQ ID NO. 27, DNA which encodes a pesticidal portion of SEQ ID NO. 28, SEQ ID NO. 37, DNA which encodes SEQ ID NO. 38, SEQ ID NO. 43, SEQ ID NO. 43, SEQ ID NO. 43, SEQ ID NO. 45, and DNA which encodes SEQ ID NO. 48,

- (b) said toxin immunoreacts with an antibody to an approximately 40-50 kDa pesticidal toxin, or a fragment thereof, from a Bacillus thuringiensis isolate selected from the group consisting of PS80JJI having the identifying characteristics of NRRL B-218679, PS149B1 having the identifying characteristics of NRRL B-21553, and PS167H2 having the identifying characteristics of NRRL B-21554:
- (c) said toxin is encoded by a nucleotide sequence wherein a portion of said nucleotide sequence can be amplified by PCR using a primer pair selected from the group consisting of SEQ ID NOS. 20 and 24 to produce a fragment of about 495 bp, SEQ ID NOS. 20 and 25 to produce a fragment of about 594 bp, SEQ ID NOS. 21 and 24 to produce a fragment of about 471 bp, and SEQ ID NOS. 21 and 25 to produce a fragment of about 580 bp:
- (d) said toxin comprises a pesticidal portion of the amino acid sequence shown in SEO ID NO. 28;
- (e) said toxin comprises an amino acid sequence which has at least about 60% homology with a pesticidal portion of an amino acid sequence selected from the group consisting of SEQ ID NO. 11, SEQ ID NO. 13, SEQ ID NO. 15, SEQ ID NO. 38, and SEO ID NO. 43:
- (f) said toxin is encoded by a nucleotide sequence which hybridizes under stringent conditions with a nucleotide sequence selected from the group consisting of DNA which encodes SEQ ID NO. 3, DNA which encodes SEQ ID NO. 5, DNA which encodes SEQ ID NO. 7, DNA which encodes SEQ ID NO. 32, DNA which encodes SEQ ID NO. 36, and DNA which encodes SEQ ID NO. 41;
- 30 (g) said toxin immunoreacts with an antibody to an approximately 10-15 kDa pesticidal toxin, or a fragment thereof, from a Bacillus thuringiensis isolate selected from the group consisting of PS80JJI having the identifying characteristics of NRRL B-18679, PS149B1 having the identifying

10

15

20

25

30

characteristics of NRRL B-21553, and PS167H2 having the identifying characteristics of NRRL B-21554:

- (h) said toxin is encoded by a nucleotide sequence wherein a portion of said nucleotide sequence can be amplified by PCR using the primer pair of SEQ ID NO. 29 and SEO ID NO. 33; and
- (i) said toxin comprises an amino acid sequence which has at least about 60% homology with an amino acid sequence selected from the group consisting of SEQ ID NO. 3, SEQ ID NO. 5, SEQ ID NO. 7, pesticidal portions of SEQ ID NO. 32, pesticidal portions of SEQ ID NO. 36, and pesticidal portions of SEQ ID NO. 41.

As used herein "stringent" conditions for hybridization refers to conditions which achieve the same, or about the same, degree of specificity of hybridization as the conditions employed by the current applicants. Specifically, hybridization of immobilized DNA on Southern blots with 32P-labeled gene-specific probes was performed by standard methods (Maniatis, T., E.F. Fritsch, J. Sambrook [1982] Molecular Cloning: A Laboratory Manual, Cold Spring Harbor Laboratory, Cold Spring Harbor, NY.). In general, hybridization and subsequent washes were carried out under stringent conditions that allowed for detection of target sequences with homology to the PS80JJ1 toxin genes. For double-stranded DNA gene probes, hybridization was carried out overnight at 20-25° C below the melting temperature (Tm) of the DNA hybrid in 6X SSPE, 5X Denhardr's solution, 0.1% SDS, 0.1 mg/ml denatured DNA. The melting temperature is described by the following formula (Beltz, G.A., K.A. Jacobs, T.H. Eickbush, P.T. Cherbas, and F.C. Kafatos [1983] Methods of Enzymology, R. Wu, L. Grossman and K. Moldave [eds.] Academic Press, New York 100:266-285).

 $Tm=81.5^{\circ} C+16.6 \ Log[Na+]+0.41(\%G+C)-0.61(\%formamide)-600/length \ of \ duplex in base pairs.$ 

Washes are typically carried out as follows:

- Twice at room temperature for 15 minutes in 1X SSPE, 0.1% SDS (low stringency wash).
- (2) Once at Tm-20°C for 15 minutes in 0.2X SSPE, 0.1% SDS (moderate stringency wash).

For oligonucleotide probes, hybridization was carried out overnight at 10-20°C below the melting temperature (Tm) of the hybrid in 6X SSPE, 5X Denhardt's solution, 0.1% SDS, 0.1 mg/ml denatured DNA. Tm for oligonucleotide probes was determined by the following formula:

10

20

25

30

PCT/US97/06463

11

Tm (° C)=2(number T/A base pairs) +4(number G/C base pairs) (Suggs, S.V., T. Miyake, E.H. Kawashime, M.J. Johnson, K. Itakura, and R.B. Wallace [1981] ICN-UCLA Symp. Dev. Biol. Using Purified Genes, D.D. Brown [ed.], Academic Press, New York, 23:683-693).

Washes were typically carried out as follows:

- Twice at room temperature for 15 minutes 1X SSPE, 0.1% SDS (low stringency wash).
- (2) Once at the hybridization temperature for 15 minutes in 1X SSPE, 0.1% SDS (moderate stringency wash).

With the teachings provided herein, one skilled in the art could readily produce and use the various toxins and polynucleotide sequences of the novel classes described herein.

Microorganisms useful according to the subject invention have been deposited in the permanent collection of the Agricultural Research Service Patent Culture Collection (NRRL), Northern Regional Research Center, 1815 North University Street, Peoria, Illinois 61604, USA.

15 The culture repository numbers of the deposited strains are as follows:

Culture	Repository No.	Deposit Date
B.t. strain PS80JJ1	NRRL B-18679	July 17, 1990
B.t. strain PS149B1	NRRL B-21553	March 28, 1996
B.t. strain PS167H2	NRRL B-21554	March 28, 1996
E. coli NM522 (pMYC2365)	NRRL B-21170	January 5, 1994
E. coli NM522 (pMYC2382)	NRRL B-21329	September 28, 1994
E. coli NM522 (pMYC2379)	NRRL B-21155	November 3, 1993
E. coli NM522(pMYC2421)	NRRL B-21555	March 28, 1996
E. coli NM522(pMYC2427)	NRRL B-21672	March 26, 1997
E. coli NM522(pMYC2429)	NRRL B-21673	March 26, 1997
E. coli NM522(pMYC2426)	NRRL B-21671	March 26, 1997

The PS80JJ1 isolate is available to the public by virtue of the issuance of U.S. Patent No. 5.151.363.

B.t. isolates PS149B1 and PS167H2 have been deposited under conditions that assure that access to the cultures will be available during the pendency of this patent application to one determined by the Commissioner of Patents and Trademarks to be entitled thereto under 37 CFR 1.14 and 35 U.S.C. 122. The deposits are available as required by foreign patent laws in countries wherein counterparts of the subject application, or its progeny, are filed. However, it

10

15

20

should be understood that the availability of a deposit does not constitute a license to practice the subject invention in derogation of patent rights granted by governmental action.

Further, the subject culture deposits will be stored and made available to the public in accord with the provisions of the Budapest Treaty for the Deposit of Microorganisms, i.e., they will be stored with all the care necessary to keep them viable and uncontaminated for a period of at least five years after the most recent request for the furnishing of a sample of a deposit, and in any case, for a period of at least 30 (thirty) years after the date of deposit or for the enforceable life of any patent which may issue disclosing the cultures. The depositor acknowledges the duty to replace the deposit(s) should the depository be unable to furnish a sample when requested, due to the condition of the deposit(s). All restrictions on the availability to the public of the subject culture deposits will be irrevocably removed upon the granting of a patent disclosing them.

Following is a table which provides characteristics of certain B.t. isolates useful according to the subject invention.

Table 1. Description of B.t. strains toxic to coleopterans					
Culture	Crystal Description	Approx. MW (kDa)	Serotype	NRRL Deposit	Deposit Date
PS80JJ1	multiple attached	130, 90, 47, 37, 14	4a4b, sotto	B-18679	7-17-90
PS149B1		130, 47, 14		B-21553	3-28-96
PS167H2		70, 47, 14		B-23554	3-28-96

25

30

Genes and toxins. The genes and toxins useful according to the subject invention include not only the full length sequences disclosed but also fragments of these sequences, variants, mutants, and fusion proteins which retain the characteristic pesticidal activity of the toxins specifically exemplified herein. As used herein, the terms "variants" or "variations" of genes refer to nucleotide sequences which encode the same toxins or which encode equivalent toxins having pesticidal activity. As used herein, the term "equivalent toxins" refers to toxins having the same or essentially the same biological activity against the target pests as the claimed toxins.

10

15

20

25

30

It should be apparent to a person skilled in this art that genes encoding active toxins can be identified and obtained through several means. The specific genes exemplified herein may be obtained from the isolates deposited at a culture depository as described above. These genes, or portions or variants thereof, may also be constructed synthetically, for example, by use of a gene synthesizer. Variations of genes may be readily constructed using standard techniques for making point mutations. Also, fragments of these genes can be made using commercially available exonucleases or endonucleases according to standard procedures. For example, enzymes such as Bal31 or site-directed mutagenesis can be used to systematically cut off nucleotides from the ends of these genes. Also, genes which encode active fragments may be obtained using a variety of restriction enzymes. Proteases may be used to directly obtain active fragments of these toxins.

Equivalent toxins and/or genes encoding these equivalent toxins can be derived from B.t. isolates and/or DNA libraries using the teachings provided herein. There are a number of methods for obtaining the pesticidal toxins of the instant invention. For example, antibodies to the pesticidal toxins disclosed and claimed herein can be used to identify and isolate other toxins from a mixture of proteins. Specifically, antibodies may be raised to the portions of the toxins which are most constant and most distinct from other B.t. toxins. These antibodies can then be used to specifically identify equivalent toxins with the characteristic activity by immunoprecipitation, enzyme linked immunosorbent assay (ELISA), or western blotting. Antibodies to the toxins disclosed herein, or to equivalent toxins, or fragments of these toxins, can readily be prepared using standard procedures in this art. The genes which encode these toxins ten he obtained from the microorganism.

Fragments and equivalents which retain the pesticidal activity of the exemplified toxins would be within the scope of the subject invention. Also, because of the redundancy of the genetic code, a variety of different DNA sequences can encode the amino acid sequences disclosed herein. It is well within the skill of a person trained in the art to create these alternative DNA sequences encoding the same, or essentially the same, toxins. These variant DNA sequences are within the scope of the subject invention. As used herein, reference to "essentially the same" sequence refers to sequences which have amino acid substitutions, deletions, additions, or insertions which do not materially affect pesticidal activity. Fragments retaining pesticidal activity are also included in this definition.

A further method for identifying the toxins and genes of the subject invention is through the use of oligonucleotide probes. These probes are detectable nucleotide sequences. These sequences may be detectable by virtue of an appropriate label or may be made inherently

10

15

20

25

fluorescent as described in International Application No. WO93/16094. As is well known in the art, if the probe molecule and nucleic acid sample hybridize by forming a strong bond between the two molecules, it can be reasonably assumed that the probe and sample have substantial homology. Preferably, hybridization is conducted under stringent conditions by techniques well-known in the art, as described, for example, in Keller, G.H., M.M. Manak (1987) DNA Probes, Stockton Press, New York, NY., pp. 169-170. Detection of the probe provides a means for determining in a known manner whether hybridization has occurred. Such a probe analysis provides a rapid method for identifying toxin-encoding genes of the subject invention. The nucleotide segments which are used as probes according to the invention can be synthesized using a DNA synthesizer and standard procedures. These nucleotide sequences can also be used as PCR primers to amplify genes of the subject invention.

Certain toxins of the subject invention have been specifically exemplified herein. Since these toxins are merely exemplary of the toxins of the subject invention, it should be readily apparent that the subject invention comprises variant or equivalent toxins (and nucleotide sequences coding for equivalent toxins) having the same or similar pesticidal activity of the exemplified toxin. Equivalent toxins will have amino acid homology with an exemplified toxin. The amino acid identity will typically be greater than 60%, preferably be greater than 75%, more preferably greater than 80%, more preferably greater than 90%, and can be greater than 95%. The amino acid homology will be highest in critical regions of the toxin which account for biological activity or are involved in the determination of three-dimensional configuration which ultimately is responsible for the biological activity. In this regard, certain amino acid substitutions are acceptable and can be expected if these substitutions are in regions which are not critical to activity or are conservative amino acid substitutions which do not affect the threedimensional configuration of the molecule. For example, amino acids may be placed in the following classes: non-polar, uncharged polar, basic, and acidic. Conservative substitutions whereby an amino acid of one class is replaced with another amino acid of the same type fall within the scope of the subject invention so long as the substitution does not materially alter the biological activity of the compound. Table 2 provides a listing of examples of amino acids belonging to each class.

Table 2.		
Class of Amino Acid Examples of Amino Acids		
Nonpolar	Ala, Val, Leu, Ile, Pro, Met, Phe, Trp	
Uncharged Polar	Gly, Ser, Thr, Cys, Tyr, Asn, Gln	
Acidic	Asp, Glu	
Basic	Lys, Arg, His	

In some instances, non-conservative substitutions can also be made. The critical factor is that these substitutions must not significantly detract from the biological activity of the toxin.

The toxins of the subject invention can also be characterized in terms of the shape and location of toxin inclusions, which are described above.

Recombinant hosts. The toxin-encoding genes harbored by the isolates of the subject invention can be introduced into a wide variety of microbial or plant hosts. Expression of the toxin gene results, directly or indirectly, in the intracellular production and maintenance of the pesticide. With suitable microbial hosts, e.g., Pseudomonas, the microbes can be applied to the situs of the pest, where they will proliferate and be ingested. The result is a control of the pest. Alternatively, the microbe hosting the toxin gene can be treated under conditions that prolong the activity of the toxin and stabilize the cell. The treated cell, which retains the toxic activity, then can be applied to the environment of the target pest.

20

25

5

10

15

Where the B.t. toxin gene is introduced via a suitable vector into a microbial host, and said host is applied to the environment in a living state, it is essential that certain host microbes be used. Microorganism hosts are selected which are known to occupy the "phytosphere" (phylloplane, phyllosphere, rhizosphere, and/or rhizoplane) of one or more crops of interest. These microorganisms are selected so as to be capable of successfully competing in the particular environment (crop and other insect habitats) with the wild-type microorganisms, provide for stable maintenance and expression of the gene expressing the polypeptide pesticide, and, desirably, provide for improved protection of the pesticide from environmental degradation and inactivation.

30

A large number of microorganisms are known to inhabit the phylloplane (the surface of the plant leaves) and/or the rhizosphere (the soil surrounding plant roots) of a wide variety of important crops. These microorganisms include bacteria, algae, and fungi. Of particular interest are microorganisms, such as bacteria, e.g., genera Pseudomonas, Erwinia, Serratia, Klebsiella,

10

15

20

25

30

Xanthomonas, Streptomyces, Rhizobium, Rhodopseudomonas, Methylophilius, Agrobacterium, Acetobacter, Lactobacillus, Arthrobacter, Azotobacter, Leuconostoc, and Alcaligenes; fungi, particularly yeast, e.g., genera Saccharomyces, Cryptococcus, Kluyveromyces, Sporobolomyces, Rhodotorula, and Aurobasidium. Of particular interest are such phytosphere bacterial species as Pseudomonas syringae, Pseudomonas fluorescens, Serratia marcescens, Acetobacter xylinum, Agrobacterium tumefaciens, Rhodopseudomonas spheroides, Xanthomonas campestris, Rhizobium melioti, Alcaligenes entrophus, and Azotobacter vinlandii; and phytosphere yeast species such as Rhodotorula rubra, R. glutinis, R. marina, R. aurantiaca, Cryptococcus albidus, C. diffluens, C. laurentii, Saccharomyces rosei, S. pretoriensis, S. cerevisiae, Sporobolomyces roseus, S. odorus, Kluyveromyces veronae, and Aureobasidium pollulans. Of particular interest are the piemented microorganisms.

A wide variety of ways are available for introducing a B.t. gene encoding a toxin into a microorganism host under conditions which allow for stable maintenance and expression of the gene. These methods are well known to those skilled in the art and are described, for example, in United States Patent No. 5.135.867, which is incorporated herein by reference.

Control of coleopterans, including corn rootworm using the isolates, toxins, and genes of the subject invention can be accomplished by a variety of methods known to those skilled in the art. These methods include, for example, the application of B.t. isolates to the pests (or their location), the application of recombinant microbes to the pests (or their locations), and the transformation of plants with genes which encode the pesticidal toxins of the subject industrient. Recombinant microbes may be, for example, a B.t., E. coli, or Pseudomonas. Transformations can be made by those skilled in the art using standard techniques. Materials necessary for these transformations are disclosed herein or are otherwise readily available to the skilled artisan.

Synthetic genes which are functionally equivalent to the toxins of the subject invention can also be used to transform hosts. Methods for the production of synthetic genes can be found in, for example, U.S. Patent No. 5,380,831.

Control of other pests such as lepidopterans and other insects, nematodes, and mites can also be accomplished by those skilled in the art using standard techniques combined with the teachings provided herein.

Treatment of cells. As mentioned above, B.t. or recombinant cells expressing a B.t. toxin can be treated to prolong the toxin activity and stabilize the cell. The pesticide microcapsule that is formed comprises the B.t. toxin within a cellular structure that has been stabilized and will protect the toxin when the microcapsule is applied to the environment of the target pest. Suitable host cells may include either prokaryotes or eukaryotes, normally being

10

15

20

25

limited to those cells which do not produce substances toxic to higher organisms, such as mammals. However, organisms which produce substances toxic to higher organisms could be used, where the toxic substances are unstable or the level of application sufficiently low as to avoid any possibility of toxicity to a mammalian host. As hosts, of particular interest will be the prokaryotes and the lower eukaryotes, such as fungi.

The cell will usually be intact and be substantially in the proliferative form when treated, rather than in a spore form, although in some instances spores may be employed.

Treatment of the microbial cell, e.g., a microbe containing the B.t. toxin gene, can be by chemical or physical means, or by a combination of chemical and/or physical means, so long as the technique does not deleteriously affect the properties of the toxin, nor diminish the cellular capability of protecting the toxin. Examples of chemical reagents are halogenating agents, particularly halogens of atomic no. 17-80. More particularly, jodine can be used under mild conditions and for sufficient time to achieve the desired results. Other suitable techniques include treatment with aldehydes, such as glutaraldehyde; anti-infectives, such as zephiran chloride and cetylpyridinium chloride; alcohols, such as isopropyl and ethanol; various histologic fixatives, such as Lugol jodine. Bouin's fixative, various acids and Helly's fixative (See: Humason, Gretchen L., Animal Tissue Techniques, W.H. Freeman and Company, 1967); or a combination of physical (heat) and chemical agents that preserve and prolong the activity of the toxin produced in the cell when the cell is administered to the host environment. Examples of physical means are short wavelength radiation such as gamma-radiation and Xradiation, freezing, UV irradiation, Ivophilization, and the like. Methods for treatment of microbial cells are disclosed in United States Patent Nos. 4,695,455 and 4,695,462, which are incorporated herein by reference.

The cells generally will have enhanced structural stability which will enhance resistance to environmental conditions. Where the pesticide is in a proform, the method of cell treatment should be selected so as not to inhibit processing of the proform to the mature form of the pesticide by the target pest pathogen. For example, formaldehyde will crosslink proteins and could inhibit processing of the proform of a polypeptide pesticide. The method of treatment should retain at least a substantial portion of the bio-availability or bioactivity of the toxin.

Characteristics of particular interest in selecting a host cell for purposes of production include ease of introducing the B.t. gene into the host, availability of expression systems, efficiency of expression, stability of the pesticide in the host, and the presence of auxiliary genetic capabilities. Characteristics of interest for use as a pesticide microcapsule include protective qualities for the pesticide, such as thick cell walls, pigmentation, and intracellular

packaging or formation of inclusion bodies; survival in aqueous environments; lack of mammalian toxicity; attractiveness to pests for ingestion; ease of killing and fixing without damage to the toxin; and the like. Other considerations include ease of formulation and handling, economics, storage stability, and the like.

Growth of cells. The cellular host containing the B.t. insecticidal gene may be grown in any convenient nutrient medium, where the DNA construct provides a selective advantage, providing for a selective medium so that substantially all or all of the cells retain the B.t. gene. These cells may then be harvested in accordance with conventional ways. Alternatively, the cells can be treated prior to harvesting.

10

15

5

The B.t. cells of the invention can be cultured using standard art media and fermentation techniques. Upon completion of the fermentation cycle the bacteria can be harvested by first separating the B.t. spores and crystals from the fermentation broth by means well known in the art. The recovered B.t. spores and crystals can be formulated into a wettable powder, liquid concentrate, granules or other formulations by the addition of surfactants, dispersants, inert carriers, and other components to facilitate handling and application for particular target pests. These formulations and application procedures are all well known in the art.

20

25

Formulations. Formulated bait granules containing an attractant and spores and crystals of the B.t. isolates, or recombinant microbes comprising the genes obtainable from the B.t. isolates disclosed herein, can be applied to the soil. Formulated product can also be applied as a seed-coating or root treatment or total plant treatment at later stages of the crop cycle. Plant and soil treatments of B.t. cells may be employed as wettable powders, granules or dusts, by mixing with various inert materials, such as inorganic minerals (phyllosilicates, carbonates, sulfates, phosphates, and the like) or botanical materials (powdered corncobs, rice hulls, walnut shells, and the like). The formulations may include spreader-sticker adjuvants, stabilizing agents, other pesticidal additives, or surfactants. Liquid formulations may be aqueous-based or non-aqueous and employed as foams, gels, suspensions, emulsifiable concentrates, or the like. The ingredients may include rheological agents, surfactants, emulsifiers, dispersants, or polymers.

30

As would be appreciated by a person skilled in the art, the pesticidal concentration will vary widely depending upon the nature of the particular formulation, particularly whether it is a concentrate or to be used directly. The pesticide will be present in at least 1% by weight and may be 100% by weight. The dry formulations will have from about 1-95% by weight of the pesticide while the liquid formulations will generally be from about 1-60% by weight of the solids in the liquid phase. The formulations will generally have from about 10<sup>4</sup> to about 10<sup>4</sup>

10

15

20

cells/mg. These formulations will be administered at about 50 mg (liquid or dry) to 1 kg or more per hectare.

The formulations can be applied to the environment of the pest, e.g., soil and foliage, by spraying, dusting, sprinkling, or the like.

Mutants of the isolates of the invention can be made by procedures well known in the art. For example, an asporogenous mutant can be obtained through ethylmethane sulfonate (EMS) mutagenesis of an isolate. The mutants can be made using ultraviolet light and nitrosoguanidine by procedures well known in the art.

A smaller percentage of the asporogenous mutants will remain intact and not lyse for extended fermentation periods; these strains are designated lysis minus (-). Lysis minus strains can be identified by screening asporogenous mutants in shake flask media and selecting those mutants that are still intact and contain toxin crystals at the end of the fermentation. Lysis minus strains are suitable for a cell treatment process that will yield a protected, encapsulated toxin protein.

To prepare a phage resistant variant of said asporogenous mutant, an aliquot of the phage lysate is spread onto nutrient agar and allowed to dry. An aliquot of the phage sensitive bacterial strain is then plated directly over the dried lysate and allowed to dry. The plates are incubated at 30°C. The plates are incubated for 2 days and, at that time, numerous colonies could be seen growing on the agar. Some of these colonies are picked and subcultured onto nutrient agar plates. These apparent resistant cultures are tested for resistance by cross streaking with the phage lysate. A line of the phage lysate is streaked on the plate and allowed to dry. The presumptive resistant cultures are then streaked across the phage line. Resistant bacterial cultures show no lysis anywhere in the streak across the phage line after overnight incubation at 30°C. The resistance to phage is then reconfirmed by plating a lawn of the resistant culture onto a nutrient agar plate. The sensitive strain is also plated in the same manner to serve as the positive control. After drying, a drop of the phage lysate is placed in the center of the plate and allowed to dry. Resistant cultures showed no lysis in the area where the phage lysate has been placed after incubation at 30°C for 24 hours.

Following are examples which illustrate procedures for practicing the invention. These examples should not be construed as limiting. All percentages are by weight and all solvent mixture proportions are by volume unless otherwise noted.

25

### Example 1 - Culturing of B.t. Isolates of the Invention

A subculture of the B.t. isolates, or mutants thereof, can be used to inoculate the following medium, a peptone, glucose, salts medium.

5	Bacto Peptone	7.5 g/l
	Glucose	1.0 g/l
	KH₂PO₄	3.4 g/l
	K <sub>2</sub> HPO <sub>4</sub>	4.35 g/l
	Salt Solution	5.0 ml/l
10	CaCl <sub>2</sub> Solution	5.0 ml/l
	pH 7.2	
	Salts Solution (100 ml)	
	MgSO <sub>4</sub> ·7H <sub>2</sub> O	2.46 g
15	MnSO <sub>4</sub> ·H <sub>2</sub> O	0.04 g
	ZnSO <sub>4</sub> ·7H <sub>2</sub> O	0.28 g
	FeSO <sub>4</sub> ·7H <sub>2</sub> O	0.40 g
	CaCl <sub>2</sub> Solution (100 ml)	
20	CaCl <sub>2</sub> ·2H <sub>2</sub> O	3.66 g

The salts solution and CaCl<sub>2</sub> solution are filter-sterilized and added to the autoclaved and cooked broth at the time of inoculation. Flasks are incubated at 30 °C on a rotary shaker at 200 rpm for 64 hr.

25 The above procedure can be readily scaled up to large fermentors by procedures well known in the art.

The B.t. spores and/or crystals, obtained in the above fermentation, can be isolated by procedures well known in the art. A frequently-used procedure is to subject the harvested fermentation broth to separation techniques, e.g., centrifugation.

# Example 2 - Protein Purification for 45 kDa 80JJ1 Protein

30

One gram of lyophilized powder of 80JJ1 was suspended in 40 ml of buffer containing 80 mM Tris-Cl pH 7.8, 5 mM EDTA, 100 µM PMSF, 0.5 µg/ml Leupeptin, 0.7. µg/ml Pepstatin, and 40 µg/ml Bestatin. The suspension was centrifuged, and the resulting supernatant was

discarded. The pellet was washed five times using 35-40 ml of the above buffer for each wash. The washed pellet was resuspended in 10 ml of 40% NaBr, 5 mM EDTA, 100  $\mu$ M PMSF, 0.5  $\mu$ g/ml Leupeptin, 0.7  $\mu$ g/ml Pepstatin, and 40  $\mu$ g/ml Bestatin and placed on a rocker platform for 75 minutes. The NaBr suspension was centrifuged, the supernatant was removed, and the pellet was treated a second time with 40% NaBr, 5 mM EDTA, 100  $\mu$ M PMSF, 0.5  $\mu$ g/ml Leupeptin, 0.7  $\mu$ g/ml Pepstatin, and 40  $\mu$ g/ml Bestatin as above. The supernatants (40% NaBr soluble) were combined and dialyzed against 10 mM CAPS pH 10.0, 1 mM EDTA at 4°C. The dialyzed extracts were centrifuged and the resulting supernatant was removed. The pellet (40% NaBr dialysis pellet) was suspended in 5 ml of H<sub>2</sub>O and centrifuged. The resultant supernatant was removed and discarded. The washed pellet was washed a second time in 10 ml of H<sub>2</sub>O and centrifuged as above. The washed pellet was suspended in 1.5 ml of H<sub>2</sub>O and contained primarily three peptides with molecular weights of approximately 47 kDa, 45 kDa, and 15 kDa when analyzed using SDS-PAGE. At this stage of purification, the suspended 40% NaBr dialysis pellet contained approximately 21 mg/ml of protein by Lowry assay.

15

20

5

10

The peptides in the pellet suspension were separated using SDS-PAGE (Laemlli, U.K. [1970] Nature 227:680) in 15% acrylamide gels. The separated proteins were then electrophoretically blotted to a PVDF membrane (Millipore Corp.) in 10 mM CAPS pH 11.0, 10% MeOH at 100 V constant. After one hour the PVDF membrane was rinsed in water briefly and placed for 3 minutes in 0.25% Coomassie blue R-250, 50% methanol, 5% acetic acid. The stained membrane was destained in 40% MeOH, 5% acetic acid. The destained membrane was air-dried at room temperature (LeGendre et al. [1989] In A Practical Guide to Protein Purification For Microsequencing, P. Matsudaira, ed., Academic Press, New York, NY). The membrane was sequenced using automated gas phase Edman degradation (Hunkapillar, M.W., R.M. Hewick, W.L. Drever, L.E. Hood [1983] Meth. Enzymol. 91:399).

25

The amino acid analysis revealed that the N-terminal sequence of the 45 kDa band was as follows: Met-Leu-Asp-Thr-Asn (SEO ID NO. 1).

The 47 kDa band was also analyzed and the N-terminal amino acid sequence was determined to be the same 5-amino acid sequence as SEQ ID NO. 1. Therefore, the N-terminal amino acid sequences of the 47 kDa peptide and the 45 kDa peptide were identical.

30

This amino acid sequence also corresponds to a sequence obtained from a 45 kDa peptide obtained from PS80JJI spore/crystal powders, using another purification protocol, with the N-terminal sequence as follows: Met-Leu-Asp-Thr-Asn-Lys-Val-Tyr-Glu-lle-Ser-Asn-Leu-Ala-Asn-Gly-Leu-Tyr-Thr-Ser-Thr-Tyr-Leu-Ser-Leu (SEQ ID NO. 2).

10

15

20

25

30

### Example 3 - Purification of the 14 kDa Peptide of PS80JJ1

0.8 ml of the white dialysis suspension (approximately 21 mg/ml) containing the 47 kDa, 45 kDa, and 15 kDa peptides, was dissolved in 10 ml of 40% NaBr, and 0.5 ml of 100 mlM EDTA were added. After about 18 hours (overnight), a white opaque suspension was obtained. This was collected by centrifugation and discarded. The supernatant was concentrated in a Centricon-30 (Amicon Corporation) to a final volume of approximately 15 ml. The filtered volume was washed with water by filter dialysis and incubated on ice, eventually forming a milky white suspension. The suspension was centrifuged and the pellet and supernatant were separated and retained. The pellet was then suspended in 1.0 ml water (approximately 6 mg/ml). The pellet contained substantially pure 15 kDa protein when analyzed by SDS-PAGE.

The N-terminal amino acid sequence was determined to be: Ser-Ala-Arg-Glu-Val-His-Ile-Glu-Ile-Asn-Asn-Thr-Arg-His-Thr-Leu-Gln-Leu-Glu-Ala-Lys-Thr-Lys-Leu (SEQ ID NO. 3).

### Example 4 - Protein Purification and Characterization of PS149B1 45 kDa Protein

The P1 pellet was resuspended with two volumes of deionized water per unit wet weight, and to this was added nine volumes of 40% (w/w) aqueous sodium bromide. This and all subsequent operations were carried out on ice or at 4-6°C. After 30 minutes, the suspension was diluted with 36 volumes of chilled water and centrifuged at 25.000 x g for 30 minutes to give a pellet and a supernatant.

The resulting pellet was resuspended in 1-2 volumes of water and layered on a 20-40% (w/w) sodium bromide gradient and centrifuged at 8,000 x g for 100 minutes. The layer banding at approximately 32% (w/w) sodium bromide (the "inclusions", or INC) was recovered and dialyzed overnight against water using a dialysis membrane with a 6-8 kDa MW cut-off. Particulate material was recovered by centrifugation at 25,000 x g, resuspended in water, and aliquoted and assayed for protein by the method of Lowry and by SDS-PAGE.

The resulting supernatant was concentrated 3- to 4-fold using Centricon-10 concentrators, then dialyzed overnight against water using a dialysis membrane with a 6-8 kDa MW cut-off. Particulate material was recovered by centrifugation at 25,000 x g, resuspended in water, and aliquoted and assayed for protein by the method of Lowry and by SDS-PAGE. This fraction was denoted as PLP2.

The peptides in the pellet suspension were separated using SDS-PAGE (Laemlli, U.K., supra) in 15% aerylamide gels. The separated proteins were then electrophoretically blotted to a PVDF membrane (Millipore Corp.) in 10 mM CAPS pH 11.0, 10% MeOH at 100 V constant.

After one hour the PVDF membrane was rinsed in water briefly and placed for 3 minutes in 0.25% Coomassie blue R-250, 50% methanol, 5% acetic acid. The stained membrane was destained in 40% MeOH, 5% acetic acid. The destained membrane was air-dried at room temperature (LeGendre et al., supra). The membrane was sequenced using automated gas phase Edman degradation (Hunkapillar et al., supra).

Protein analysis indicated the presence of two major polypeptides, with molecular weights of 47 kDa and 14 kDa. Molecular weights were measured against standard polypeptides of known molecular weight. This process provides only an estimate of true molecular weight. The 47 kDa band from PS149B1 migrated on SDs-PAGE in a manner indistinguishable from the 47 kDa protein from PS80J1. Likewise, the 14 kDa band from PS149B1 migrated on SDs-PAGE in a manner indistinguishable from 14 kDa bands from PS167H2 and PS80J1. Apart from these two polypeptides, which were estimated to account for 25-35% (47 kDa) and 35-55% (15 kDa) of the Coomassie staining material respectively, there may be minor bands, including those of estimated MW at 46 kDa, 130 kDa, and 70 kDa.

Protein analysis indicated that fraction INC contained a single polypeptide with MW of 47 kDa, and that fraction P1.P2 contained a single polypeptide with MW of 14 kDa. These polypeptides were recovered in yields greater than 50% from P1.

The N-terminal amino acid sequence for the purified 47 kDa protein from PS149B1 is: Met-Leu-Asp-Thr-Asn-Lys-Val-Tyr-Glu-lle-Ser-Asn-His-Ala-Asn-Gly-Leu-Tyr-Ala-Ala-Thr-Tyr-Leu-Ser-Leu (SEQ ID NO. 4).

The N-terminal amino acid sequence for the purified 14 kDa protein from PS149B1 is:

Ser-Ala-Arg-Glu-Val-His-Ile-Asp-Val-Asn-Asn-Lys-Thr-Gly-His-Thr-Leu-Gln-Leu-Glu-AspLys-Thr-Lys-Leu-Asp-Gly-Gly-Arg-Trp-Arg-Thr-Ser-Pro-Xaa-Asn-Val-Ala-Asn-Asp-Gln-IleLys-Thr-Phe-Val-Ala-Glu-Ser-Asn (SEO ID NO. 5).

#### Example 5 - Amino Acid Sequence for 45 kDa and 14 kDa Toxins of PS167H2

The N-terminal amino acid sequence for the purified 45 kDa protein from PS167H2 is:

Met-Leu-Asp-Thr-Asn-Lys-Ile-Tyr-Glu-Ile-Ser-Asn-Tyr-Ala-Asn-Gly-Leu-His-Ala-Ala-Thr
Tyr-Leu-Ser-Leu (SEQ ID NO. 6).

The N-terminal amino acid sequence for the purified 14 kDa protein from PS167H2 is: Scr-Ala-Arg-Glu-Val-His-Ile-Asp-Val-Asn-Asn-Lys-Thr-Gly-His-Thr-Leu-Gln-Leu-Glu-Asp-Lys-Thr-Lys-Leu (SEQ ID NO. 7).

These amino acid sequences can be compared to the sequence obtained for the 47 kDa peptide obtained from 80JJ1 spore/crystal powders with the N-terminal sequence (SEQ ID NO.

20

25

 and to the sequence obtained for the 14 kDa peptide obtained from 80JJ1 spore/crystal powders with the N-terminal sequence (SEQ ID NO. 3).

Clearly, the 45-47 kDa proteins are highly related and probably represent one gene family, and the 14 kDa proteins are highly related and probably represent another gene family.

Example 6 — Molecular Cloning, Expression, and DNA Sequence Analysis of a Novel & Endotoxin Gene from Bacillus thuringiensis Strain PS80J11

Total cellular DNA was prepared from Bacillus thuringiensis (B.1.) cells grown to an optical density, at 600 nm, of 1.0. Cells were pelleted by centrifugation and resuspended in protoplast buffer (20 mg/ml lysozyme in 0.3 M sucrose, 25 mM Tris-Cl [pH 8.0], 25 mM EDTA). After incubation at 37°C for 1 hour, protoplasts were lysed by two cycles of freezing and thawing. Nine volumes of a solution of 0.1 M NaCl, 0.1% SDS, 0.1 M Tris-Cl were added to complete lysis. The cleared lysate was extracted twice with phenol:chloroform (1:1). Nucleic acids were precipitated with two volumes of ethanol and pelleted by centrifugation. The pellet was resuspended in TE buffer and RNase was added to a final concentration of 50 μg/ml. After incubation at 37°C for 1 hour, the solution was extracted once each with phenol:chloroform (1:1) and TE-saturated chloroform. DNA was precipitated from the aqueous phase by the addition of one-tenth volume of 3 M NaOAc and two volumes of ethanol. DNA was pelleted by centrifugation, washed with 70% ethanol, dried, and resuspended in TE buffer.

An oligonucleotide probe for the gene encoding the PS80JI1 45 kDa toxin was designed from N-terminal peptide sequence data. The sequence of the 29-base oligonucleotide probe was: 5'-ATG YTW GAT ACW AAT AAA GTW TAT GAA AT-3' (SEQ ID NO. 8)

This oligonucleotide was mixed at four positions as shown. This probe was radiolabeled with <sup>32</sup>P and used in standard condition hybridization of Southern blots of PS80JII total cellular DNA digested with various restriction endonucleases. Representative autoradiographic data from these experiments showing the sizes of DNA restriction fragments containing sequence homology to the 44.3 kDa toxin oligonucleotide probe of SEQ ID NO. 8 are presented in Table 3.

10

15

20

Table 3. RFLP of PS80JJ1 cellular DNA fragments on Southern blots that hybridized under standard conditions with the 44.3 kDa toxin gene oligonucleotide probe (SEQ ID NO.8)

NO. 6)		
Restriction Enzyme	Approximate Fragment Size (kbp)	
<i>Eco</i> RI	6.0	
HindIII	8.3	
KpnI	7.4	
PstI	11.5	
XbaI	9.1	

These DNA fragments identified in these analyses contain all or a segment of the PS80JJI 45 kDa toxin gene. The approximate sizes of the hybridizing DNA fragments in Table 3 are in reasonable agreement with the sizes of a subset of the PS80JJI fragments hybridizing with a PS80JJI 45 kDa toxin subgene probe used in separate experiments, as predicted (see Table 4, below).

A gene library was constructed from PS80JJ1 DNA partially digested with Sau3A1. 
Partial restriction digests were fractionated by agarose gel electrophoresis. DNA fragments 9.3 
to 23 kbp in size were excised from the gel, electroeluted from the gel slice, purified on an 
Elutip-D ion exchange column (Schleicher and Schuell, Keene, NH), and recovered by ethanol 
precipitation. The Sau3A1 inserts were ligated into BamH1-digested LambdaGem-11 (Promega, 
Madison, WI). Recombinant phage were packaged and plated on E. coli KW251 cells. Plaques 
were screened by hybridization with the oligonucleotide probe described above. Hybridizing 
phage were plaque-purified and used to infect liquid cultures of E. coli KW251 cells for isolation 
of DNA by standard procedures (Maniatis et al., supra).

Southern blot analysis revealed that one of the recombinant phage isolates contained an approximately 4.8 kbp Xba1-Sac1 band that hybridized to the PS80JJ1 toxin gene probe. The SacI site flanking the PS80JJ1 toxin gene is a phage vector cloning site, while the flanking XbaI site is located within the PS80JJ1 DNA insert. This DNA restriction fragment was subcloned by standard methods into pBluescript S/K (Stratagene, San Diego, CA) for sequence analysis. The resultant plasmid was designated pMYC2421. The DNA insert was also subcloned into pHTBlueII (an E. coli/B. thuringiensis shuttle vector comprised of pBluescript S/K (Stratagene, La Jolla, CA] and the replication origin from a resident B.t. plasmid [D. Lereclus et al. (1989) FEMS Microbiology Letters 60:211-218] to yield pMYC2420.

25

10

15

20

25

30

An oligonucleotide probe for the gene encoding the PS80JJ1 14 kDa toxin was designed from N-terminal peptide sequence data. The sequence of the 28-base oligonucleotide probe was: 5' GW GAA GTW CAT ATW GAA ATW AAT AAT AC 3' (SEQ ID NO. 29). This oligonucleotide was mixed at four positions as shown. The probe was radiolabelled with <sup>32</sup>P and used in standard condition hybridizations of Southern blots of PS80JJ1 total cellular and pMYC2421 DNA digested with various restriction endonucleases. These RFLP mapping experiments demonstrated that the gene encoding the 14 kDa toxin is located on the same genomic *EcoRI* fragment that contains the N-terminal coding sequence for the 44.3 kDa toxin.

To test expression of the PS80JJ1 toxin genes in B.t., pMYC2420 was transformed into the acrystalliferous (Cry-) B.t. host, CryB (A. Aronson, Purdue University, West Lafayette, IN), by electroporation. Expression of both the approximately 14 and 44.3 kDa PS80JJ1 toxins encoded by pMYC2420 was demonstrated by SDS-PAGE analysis. Toxin crystal preparations from the recombinant CryB[pMYC2420] strain, MR536, were assayed and found to be active against western corn rootworm.

The PS80JJ1 toxin genes encoded by pMYC2421 were sequenced using the ABI373 automated sequencing system and associated software. The sequence of the entire genetic locus containing both open reading frames and flanking nucleotide sequences is shown in SEQ ID NO. 30. The termination codon of the 14 kDa toxin gene is 121 base pairs upstream (5') from the initiation codon of the 44.3 kDa toxin gene (Figure 2). The PS80JJJ 14 kDa toxin open reading frame nucleotide sequence (SEQ ID NO. 31), the 44.3 kDa toxin open reading frame nucleotide sequence (SEQ ID NO. 10), and the respective deduced amino acid sequences (SEQ ID NO. 32 and SEO ID NO. 11) are novel compared to other toxin genes encoding pesticidal proteins.

Thus, the nucleotide sequence encoding the 14 kDa toxin of PS80JJ1 is shown in SEQ ID NO. 31. The deduced amino acid sequence of the 14 kDa toxin of PS80JJ1 is shown in SEQ ID NO. 32. The nucleotide sequences encoding both the 14 and 45 kDa toxins of PS80JJ1, as well as the flanking sequences, are shown in SEQ ID NO. 30. The relationship of these sequences is shown in Figure 2.

A subculture of *E. coli* NM522 containing plasmid pMYC2421 was deposited in the permanent collection of the Patent Culture Collection (NRRL), Regional Research Center, 1815 North University Street, Peoria, IL 61604 USA on March 28, 1996. The accession number is NRRL B-21555

WO 97/40162 PCT/US97/06463

27

Example 7 – RFLP and PCR Analysis of Additional Novel & Endotoxin Genes from Bacillus thuringiensis Strains PS149B1 and PS167H2

Two additional strains active against corn rootworm, PS149B1 and PS167H2, also produce parasporal protein crystals comprised in part of polypeptides approximately 14 and 45 kDa in size. Southern hybridization and partial DNA sequence analysis were used to examine the relatedness of these toxins to the 80JJ1 toxins. DNA was extracted from these B.t. strains as described above, and standard Southern hybridizations were performed using the 14 kDa toxin oligonucleotide probe (SEQ ID NO. 29) and an approximately 800 bp PCR fragment of the 80JJ1 44.3 kDa toxin gene-encoding sequence. Representative RFLP data from these experiments showing the sizes of DNA restriction fragments containing sequence homology to the 44.3 kDa toxin are presented in Table 4. Representative RFLP data from these experiments showing the sizes of DNA restriction fragments containing sequence homology to the approximately 14 kDa toxin are presented in Table 5.

Each of the three strains exhibited unique RFLP patterns. The hybridizing DNA fragments from PS149B1 or PS167H2 contain all or part of toxin genes with sequence homology to the PS80JI1 14 kDa toxin gene.

Portions of the toxin genes in PS149B1 or PS167H2 were amplified by PCR using forward and reverse oligonucleotide primer pairs designed based on the PS80JJ1 44.3 kDa toxin gene sequence. For PS149B1, the following primer pair was used:

Forward:

 $5^{\prime}\text{-ATG}$  YTW GAT ACW AAT AAA GTW TAT GAA AT-3 $^{\prime}$  (SEQ ID NO. 8)

Reverse:

5'-GGA TTA TCT ATC TCT GAG TGT TCT TG-3' (SEO ID NO. 9)

For PS167H2, the same primer pair was used. These PCR-derived fragments were sequenced using the AB1373 automated sequencing system and associated software. The partial gene and peptide sequences obtained are shown in SEQ ID NO. 12-15. These sequences contain portions of the nucleotide coding sequences and peptide sequences for novel corn rootworm-active toxins present in B.t. strains PS149B1 or PS167H2.

25

30

Example 8 — Molecular Cloning and DNA Sequence Analysis of Novel 5-Endotoxin Genes from Bacillus thuringiensis Strains PS149B1 and PS167H2

Total cellular DNA was extracted from strains PS149B1 and PS167H2 as described for PS80JJ1. Gene libraries of size-fractionated Sau3A partial restriction fragments were constructed in Lambda-Gen11 for each respective strain as previously described. Recombinant phage were packaged and plated on E. coli KW251 cells. Plaques were screened by hybridization with the oligonucleotide probe specific for the 44 kDa toxin gene. Hybridizing phage were plaque-purified and used to infect liquid cultures of E. coli KW251 cells for isolation of DNA by standard procedures (Maniatis et al., supra).

For PS167H2, Southern blot analysis revealed that one of the recombinant phage isolates contained an approximately 4.0 to 4.4 kbp HindIII band that hybridized to the PS80JJ1 44 kDa toxin gene 5' oligonucleotide probe (SEQ ID NO. 8). This DNA restriction fragment was subcloned by standard methods into pBluescript S/K (Stratgene, San Diego, CA) for sequence analysis. The fragment was also subcloned into the high copy number shuttle vector, pHT370 (Arantes, O., D. Lereclus [1991] Gene 108:115-119) for expression analyses in Bacillus thuringiensis (see below). The resultant recombinant, high copy number bifunctional plasmid was designated pMYC2427.

The PS167H2 toxin genes encoded by pMYC2427 were sequenced using the ABI automated sequencing system and associated software. The sequence of the entire genetic locus containing both open reading frames and flanking nucleotide sequences is shown in SEQ ID NO. 34. The termination codon of the 14 kDa toxin gene is 107 base pairs upstream (5') from the initiation codon of the 44 kDa toxin gene. The PS167H2 14 kDa toxin coding sequence (SEQ ID NO. 35), the 44 kDa toxin coding sequence (SEQ ID NO. 37), and the respective deduced amino acid sequences, SEQ ID NO. 36 and SEQ ID NO. 38, are novel compared to other known toxin genes encoding pesticidal proteins. The toxin genes are arranged in a similar manner to, and have some homology with, the PS80JII 14 and 44 kDa toxins.

A subculture of E. coli NM522 containing plasmid pMYC2427 was deposited in the permanent collection of the Patent Culture Collection (NRRL), Regional Research Center, 1815 North University Street, Peoria, Illinois 61604 USA on 26 March 1997. The accession number is NRRL B-21672.

For PS149B1, Southern blot analysis using the PS80IJ1 44 kDa oligonucleotide 5' probe (SEQ ID NO. 8) demonstrated hybridization of an approximately 5.9 kbp Cla1 DNA fragment. Complete Cla1 digests of PS149B1 genomic DNA were size fractionated on agarose gels and cloned into pIITBlueII. The fragment was also subcloned into the high copy number shuttle

10

30

vector, pHT370 (Arantes, O., D. Lereclus [1991] Gene 108:115-119) for expression analyses in Bacillus thuringiensis (see below). The resultant recombinant, high copy number bifunctional plasmid was designated pMYC2429.

The PS149B1 toxin genes encoded by pMYC2429 were sequenced using the ABI automated sequencing system and associated software. The sequence of the entire genetic locus containing both open reading frames and flanking nucleotide sequences is shown in SEQ ID NO. 39. The termination codon of the 14 kDa toxin gene is 108 base pairs upstream (5') from the initiation codon of the 44 kDa toxin gene. The PS149B1 14 kDa toxin coding sequence (SEQ ID NO. 40), the 44 kDa toxin coding sequence (SEQ ID NO. 42), and the respective deduced amino acid sequences, SEQ ID NO. 41 and SEQ ID NO. 43, are novel compared to other known toxin genes encoding pesticidal proteins. The toxin genes are arranged in a similar manner as, and have some homology with, the PS80JJ1 and PS167H2 14 and 44 kDa toxins. Together, these three toxin operons comprise a new family of pesticidal toxins.

A subculture of *E. coli* NM522 containing plasmid pMYC2429 was deposited in the permanent collection of the Patent Culture Collection (NRRL), Regional Research Center, 1815 North University Street, Peoria, Illinois 61604 USA on 26 March 1997. The accession number is NRRL B-21673.

# Example 9 – PCR Amplification for Identification and Cloning Novel Corn Rootworm-Active Toxin

The DNA and peptide sequences of the three novel approximately 45 kDa corn rootworm-active toxins from PS80JI1, PS149B1, and PS16"H2 (SEQ ID NOS. 12-15) were aligned with the Genetics Computer Group sequence analysis program Pileup using a gap weight of 3.00 and a gap length weight of 0.10. The sequence alignments were used to identify conserved peptide sequences to which oligonucleotide primers were designed that were likely to hybridize to genes encoding members of this novel toxin family. Such primers can be used in PCR to amplify diagnostic DNA fragments for these and related toxin genes. Numerous primer designs to various sequences are possible, four of which are described here to provide an example. These peptide sequences are:

Asp-Ile-Asp-Asp-Tyr-Asn-Leu (SEQ ID NO. 16)

Trp-Phe-Leu-Phe-Pro-Ile-Asp (SEQ ID NO. 17)

Gin-Ile-Lys-Thr-Thr-Pro-Tyr-Tyr (SEQ ID NO. 18)

Tvr-Glu-Trp-Gly-Thr-Glu (SEO ID NO. 19).

The corresponding nucleotide sequences are:

15

20

25

30

31

5'-GATATWGATGAYTAYAAYTTR-3' (SEQ ID NO. 20)

5'-TGGTTTTTRTTTCCWATWGAY-3' (SEQ ID NO. 21)

5'-CAAATHAAAACWACWCCATATTAT-3' (SEQ ID NO. 22)

5'-TAYGARTGGGGHACAGAA-3' (SEQ ID NO. 23).
Forward primers for polymerase amplification in thermocycle reactions were designed based on

the nucleotide sequences of SEQ ID NOS. 20 and 21.

Reverse primers were designed based on the reverse complement of SEQ ID NOS. 22

neverse primers were designed based on the reverse complement of SEQ ID NOS, 22 and 23:

# 5'-ATAATATGGWGTWGTTTTDATTTG-3' (SEQ ID NO. 24) 5'-TTCTGTDCCCCAYTCRTA-3' (SEO ID NO. 25)

These primers can be used in combination to amplify DNA fragments of the following sizes (Table 6) that identify genes encoding novel corn rootworm toxins.

 Table 6. Predicted sizes of diagnostic DNA fragments (base pairs) amplifiable with primers specific for novel com rootworm-active toxins

 Primer pair (SEQ ID NO.)
 DNA fragment size (bp)

 20 + 24
 495

 20 + 25
 594

 21 + 24
 471

 21 + 25
 580

Similarly, entire genes encoding novel corn rootworm-active toxins can be isolated by polymerase amplification in thermocycle reactions using primers designed based on DNA sequences flanking the open reading frames. For the PS80JII 44.3 kDa toxin, one such primer pair was designed, synthesized, and used to amplify a diagnostic 1613 bp DNA fragment that included the entire toxin coding sequence. These primers are:

Forward: 5'-CTCAAAGCGGATCAGGAG-3' (SEQ ID NO. 26)

Reverse: 5'-GCGTATTCGGATATGCTTGG-3' (SEQ ID NO. 27).

For PCR amplification of the PS80JI1 14 kDa toxin, the oligonucleotide coding for the N-terminal peptide sequence (SEQ ID NO. 29) can be used in combination with various reverse oligonucleotide primers based on the sequences in the PS80JI1 toxin gene locus. One such reverse primer has the following sequence:

5' CATGAGATTTATCTCCTGATCCGC 3' (SEO ID NO. 33).

10

15

20

2.5

30

When used in standard PCR reactions, this primer pair amplified a diagnostic 1390 bp DNA fragment that includes the entire 14 kDa toxin coding sequence and some 3' flanking sequences corresponding to the 121 base intergenic spacer and a portion of the 44.3 kDa toxin gene. When used in combination with the 14 kDa forward primer, PCR will generate a diagnostic 322 base pair DNA fragment.

## Example 10 - Bioassay of Protein

A preparation of the insoluble fraction from the dialyzed NaBr extract of 80JJ1 containing the 47 kDa, 45 kDa, and 15 kDa peptides was bioassayed against Western corn rootworm and found to exhibit significant toxin activity.

#### Example 11 - Bioassay of Protein

The purified protein fractions from PS149B1 were bioassayed against western corn rootworm and found to exhibit significant toxin activity when combined. In fact, the combination restored activity to that noted in the original preparation (P1). The following bioassay data set presents percent mortality and demonstrates this effect.

Table 7.				
Concentration (µg/cm²)	P1	INC	P1.P2	INC + P1.P2
300	88, 100, 94	19	13	100
100	94, 50, 63	31	38	94
33.3	19, 19, 44	38	13	50
11.1	13, 56, 25	12	31	13
3.7	0, 50, 0	0	31	13
1.2	13, 43, 12	0	12	19
0.4	6, 12, 6	25	19	6

#### Example 12 - Clone Dose-Response Bioassays

The PS80JJ1 toxin operon was also subcloned from pMYC2421 into pHT370 for direct comparison of bioactivity with the recombinant toxins cloned from PS149B1 and PS167H2. The resultant recombinant, high copy number bifunctional plasmid was designated pMYC2426.

10

15

20

25

30

A subculture of E. coli NM522 containing plasmid pMYC2426 was deposited in the permanent collection of the Patent Culture Collection (NRRL), Regional Research Center, 1815 North University Street, Peoria, Illinois 61604 USA on 26 March 1997. The accession number is NRRL B-21671.

To test expression of the PS80JJI, PS149B1 and PS167H2 toxin genes in B.t., pMYC2426, pMYC2427 and pMYC2429 were separately transformed into the acrystalliferous (Cry-) B.t. host, CryB (A. Aronson, Purdue University, West Lafayette, IN), by electroporation. The recombinant strains were designated MR543 (CryB [pMYC2426]), MR544 (CryB [pMYC2427]) and MR546 (CryB [pMYC2429]), respectively . Expression of both the approximately 14 and 44 kDa toxins was demonstrated by SDS-PAGE analysis for each recombinant strain

Toxin crystal preparations from the recombinant strains were assayed against western corn rootworm. Their diet was amended with sorbic acid and SIGMA pen-strep-ampho-B. The material was top-loaded at a rate of 50 µl of suspension per cm² diet surface area. Bioassays were run with neonate Western corn rootworm larvae for 4 days at approximately 25°C. Percentage mortality and top-load LC<sub>50</sub> estimates for the clones (pellets) are set forth in Table 8.

Table 8.				
	Percentage mortali	y at given protein conc	entration (µg/cm²

MR544 pellet	72	32	21	
MR546 pellet	52	32	21	
dH2O	7			

### Example 13 - Insertion and Expression of Toxin Genes Into Plants

One aspect of the subject invention is the transformation of plants with genes encoding the insecticidal toxin. The transformed plants are resistant to attack by the target pest.

The novel com rootworm-active genes described here can be optimized for expression in other organisms. Maize optimized gene sequences encoding the 14 and 44 kDa PS80JJ1 toxins are disclosed in SEQ ID NO. 44 and SEQ ID NO. 45, respectively.

10

15

20

25

30

Genes encoding pesticidal toxins, as disclosed herein, can be inserted into plant cells using a variety of techniques which are well known in the art. For example, a large number of cloning vectors comprising a replication system in E. coli and a marker that permits selection of the transformed cells are available for preparation for the insertion of foreign genes into higher plants. The vectors comprise, for example, pBR322, pUC series, M13mp series. pACYC184, etc. Accordingly, the sequence encoding the B.t. toxin can be inserted into the vector at a suitable restriction site. The resulting plasmid is used for transformation into E. cali The E. coli cells are cultivated in a suitable nutrient medium, then harvested and lysed. The plasmid is recovered. Sequence analysis, restriction analysis, electrophoresis, and other biochemical-molecular biological methods are generally carried out as methods of analysis. After each manipulation, the DNA sequence used can be cleaved and joined to the next DNA sequence. Each plasmid sequence can be cloned in the same or other plasmids. Depending on the method of inserting desired genes into the plant, other DNA sequences may be necessary. If, for example, the Ti or Ri plasmid is used for the transformation of the plant cell, then at least the right border, but often the right and the left border of the Ti or Ri plasmid T-DNA, has to be joined as the flanking region of the genes to be inserted.

The use of T-DNA for the transformation of plant cells has been intensively researched and sufficiently described in EP 120 516; Hoekema (1985) In: The Binary Plant Vector System, Offiset-durkkerij Kanters B.V., Alblasserdam, Chapter 5; Fraley et al., Crit. Rev. Plant Sci. 4:1-46: and An et al. (1985) EMBO J. 4:277-287.

Once the inserted DNA has been integrated in the genome, it is relatively stable there and, as a rule, does not come out again. It normally contains a selection marker that confers on the transformed plant cells resistance to a biocide or an antibiotic, such as kanamycin, G 418, bleomycin, hygromycin, or chloramphenicol, inter alia. The individually employed marker should accordingly permit the selection of transformed cells rather than cells that do not contain the inserted DNA.

A large number of techniques are available for inserting DNA into a plant host cell. 
Those techniques include transformation with T-DNA using Agrobacterium numefaciens or 
Agrobacterium rhizogenes as transformation agent, fusion, injection, biolistics (microparticle 
bombardment), or electroporation as well as other possible methods. If Agrobacteria are used 
for the transformation, the DNA to be inserted has to be cloned into special plasmids, namely 
either into an intermediate vector or into a binary vector. The intermediate vectors can be 
integrated into the Ti or Ri plasmid by homologous recombination owing to sequences that are 
homologous to sequences in the T-DNA. The Ti or Ri plasmid also comprises the vir region

10

15

20

25

30

necessary for the transfer of the T-DNA. Intermediate vectors cannot replicate themselves in Agrobacteria. The intermediate vector can be transferred into Agrobacterium tumefaciens by means of a helper plasmid (conjugation). Binary vectors can replicate themselves both in E. coli and in Agrobacteria. They comprise a selection marker gene and a linker or polylinker which are framed by the right and left T-DNA border regions. They can be transformed directly into Agrobacteria (Holsters et al. [1978] Mol. Gen. Genet. 163:181-187). The Agrobacterium used as host cell is to comprise a plasmid carrying a vir region. The vir region is necessary for the transfer of the T-DNA into the plant cell. Additional T-DNA may be contained. The bacterium so transformed is used for the transformation of plant cells. Plant explants can advantageously be cultivated with Agrobacterium tumefaciens or Agrobacterium rhizogenes for the transfer of the DNA into the plant cell. Whole plants can then be regenerated from the infected plant material (for example, pieces of leaf, segments of stalk, roots, but also protoplasts or suspensioncultivated cells) in a suitable medium, which may contain antibiotics or biocides for selection. The plants so obtained can then be tested for the presence of the inserted DNA. No special demands are made of the plasmids in the case of injection and electroporation. It is possible to use ordinary plasmids, such as, for example, pUC derivatives.

The transformed cells grow inside the plants in the usual manner. They can form germ cells and transmit the transformed trait(s) to progeny plants. Such plants can be grown in the normal manner and crossed with plants that have the same transformed hereditary factors or other hereditary factors. The resulting hybrid individuals have the corresponding phenotypic properties.

In a preferred embodiment of the subject invention, plants will be transformed with genes wherein the codon usage has been optimized for plants. See, for example, U.S. Patent No. 5,380,831, which is hereby incorporated by reference. Also, advantageously, plants encoding a truncated toxin will be used. The truncated toxin typically will encode about 55% to about 80% of the full length toxin. Methods for creating synthetic B.t. genes for use in plants are known in the art.

#### Example 14 - Cloning of B.t. Genes Into Insect Viruses

A number of viruses are known to infect insects. These viruses include, for example, baculoviruses and entomopoxviruses. In one embodiment of the subject invention, genes encoding the insecticidal toxins, as described herein, can be placed within the genome of the insect virus, thus enhancing the pathogenicity of the virus. Methods for constructing insect viruses which comprise B.t. toxin genes are well known and readily practiced by those skilled

in the art. These procedures are described, for example, in Merryweather et al. (Merryweather, A.T., U. Weyer, M.P.G. Harris, M. Hirst, T. Booth, R.D. Possec (1990) J. Gen. Virol. 71:1535-1544) and Martens et al. (Martens, J.W.M., G. Honee, D. Zuidema, J.W.M. van Lent, B. Visser, J.M. Vlak (1990) Appl. Environmental Microbiol. 56(9):2764-2770).

5

It should be understood that the examples and embodiments described herein are for illustrative purposes only and that various modifications or changes in light thereof will be suggested to persons skilled in the art and are to be included within the spirit and purview of this application and the scope of the appended claims.

SEQUENCE LISTING

# (1) GENERAL INFORMATION:

(i) APPLICANT:

Applicant Name(s): MYCOGEN CORPORATION
Street address: 5501 Oberlin Drive

#### Claims

1. An isolated polynucleotide comprising a nucleotide sequence which encodes a toxin active against a non-mammalian pest wherein said nucleotide sequence hybridizes under stringent conditions with a nucleotide sequence selected from the group consisting of: DNA which encodes SEQ ID NO. 4; DNA which encodes SEQ ID NO. 5; SEQ ID NO. 2; DNA which encodes SEQ ID NO. 4; DNA which encodes SEQ ID NO. 11; SEQ ID NO. 12; DNA which encodes SEQ ID NO. 13; DNA which encodes SEQ ID NO. 13; DNA which encodes SEQ ID NO. 16; DNA which encodes SEQ ID NO. 17; DNA which encodes SEQ ID NO. 18; DNA which encodes SEQ ID NO. 19; SEQ ID NO. 20; SEQ ID NO. 21; SEQ ID NO. 22; SEQ ID NO. 23; SEQ ID NO. 24; SEQ ID NO. 25; SEQ ID NO. 26; SEQ ID NO. 27; DNA which encodes a pesticidal portion of SEQ ID NO. 28; SEQ ID NO. 37; DNA which encodes SEQ ID NO. 38; SEQ ID NO. 43.

- The isolated polynucleotide, according to claim 1, wherein said nucleotide sequence hybridizes with DNA which encodes SEQ ID NO. 2.
- The isolated polynucleotide, according to claim 1, wherein said nucleotide sequence hybridizes with SEQ ID NO. 10.
- The isolated polynucleotide, according to claim 1, wherein said toxin has a molecular weight of approximately 40-50 kDa.
- 5. An isolated polymucleotide comprising a nucleotide sequence which encodes a toxin active against a non-mammalian pest wherein said toxin immunoreacts with an antibody to an approximately 40-50 kDa toxin from a Bacillus thuringiensis isolate selected from the group consisting of PS80JJ1, having the identifying characteristics of NRRL B-18679; PS149B1, having the identifying characteristics of NRRL B-21553; and PS167H2, having the identifying characteristics of NRRL B-21554.
- The isolated polynucleotide, according to claim 5, wherein said nucleotide sequence encodes a toxin of approximately 40-50 kDa.

2

3

5

1

	08
l	7. An isolated polynucleotide comprising a nucleotide sequence which encodes a toxin
2	active against a non-mammalian pest wherein a portion of said nucleotide sequence can be
3	amplified by PCR using a primer pair selected from the following group:
4	SEQ ID NOS. 20 and 24 to produce a fragment of about 495 bp; SEQ ID NOS. 20 and
5	25 to produce a fragment of about 594 bp; SEQ ID NOS. 21 and 24 to produce a fragment of
5	about 471 bp; and SEQ ID NOS. 21 and 25 to produce a fragment of about 580 bp.
ı	8. The isolated polynucleotide, according to claim 7, wherein said nucleotide sequence
2	encodes a toxin of approximately 40-50 kDa.
l	9. An isolated polynucleotide comprising a nucleotide sequence which encodes a toxin
2	active against a non-mammalian pest wherein said toxin comprises a pesticidal portion of an
3	amino acid sequence shown in the group selected from SEQ ID NO. 30, SEQ ID NO. 34, and
1	SEQ ID NO. 39.
l	10. The isolated polynucleotide, according to claim 9, wherein said nucleotide sequence
2	encodes a toxin which comprises a pesticidal portion of the consensus sequence shown in Figure
3	1.
l	11. The isolated polynucleotide, according to claim 9, wherein said nucleotide sequence
2	encodes a toxin of approximately 40-50 kDa.

- 12. An isolated polynucleotide comprising a nucleotide sequence which encodes a toxin active against a non-mammalian pest wherein said toxin comprises an amino acid sequence which has at least about 75% homology with a pesticidal portion of an amino acid sequence selected from the group consisting of SEQ ID NO. 11, SEQ ID NO. 13, SEQ ID NO. 15, SEQ ID NO. 38, and SEO ID NO. 43.
- 13. The isolated polynucleotide, according to claim 12, wherein said nucleotide sequence encodes a toxin which comprises an amino acid sequence which has at least about 80% homology with a pesticidal portion of an amino acid sequence selected from the group consisting of SEQ ID NO. 11, SEQ ID NO. 13, SEQ ID NO. 15, SEQ ID NO. 38, and SEQ ID NO. 43.

approximately 40-50 kDa.

69
14. The isolated polynucleotide, according to claim 12, wherein said nucleotide
sequence encodes a toxin which comprises an amino acid sequence which has at least about 90%
homology with a pesticidal portion of an amino acid sequence selected from the group consisting
of SEQ ID NO. 11, SEQ ID NO. 13, SEQ ID NO. 15, SEQ ID NO. 38, and SEQ ID NO. 43.
15. An isolated polynucleotide comprising a nucleotide sequence which encodes a toxin
which is active against a non-mammalian pest, wherein said nucleotide sequence is from a
Bacillus thuringiensis isolate selected from the group consisting of PS80JJ1, having the

mutants thereof which retain pesticidal activity.

16. The isolated polynucleotide, according to claim 15, wherein said toxin is

identifying characteristics of NRRL B-18679; PS149B1, having the identifying characteristics

of NRRL B-21553; and PS167H2, having the identifying characteristics of NRRL B-21554; and

- 17. The isolated polynucleotide, according to claim 15, wherein said toxin is approximately 10-15 kDa.
- 18. An isolated polynucleotide comprising a nucleotide sequence which encodes a toxin active against a non-mammalian pest wherein said nucleotide sequence hybridizes under stringent conditions with a nucleotide sequence selected from the group consisting of: DNA which encodes SEQ ID NO. 3; DNA which encodes SEQ ID NO. 5; and DNA which encodes SEQ ID NO. 7.
- The isolated polynucleotide, according to claim 18, wherein said nucleotide sequence encodes a toxin of about 10-15 kDa.
  - 20. An isolated polynucleotide comprising a nucleotide sequence which encodes a toxin active against a non-mammalian pest wherein said toxin immunoreacts with an antibody to an approximately 10-15 kDa toxin, or a fragment thereof, from a Bacillus thuringiensis isolate selected from the group consisting of PS80JJ1, having the identifying characteristics of NRRL B-18679; PS149B1, having the identifying characteristics of NRRL B-21553; and PS167H2, having the identifying characteristics of NRRL B-21554.

	,,	
1	21. The isolated polynucleotide, according to claim 20, wherein said nucleotide	
2	sequence encodes a toxin of approximately 10-15 kDa.	
1	22. An isolated polynucleotide comprising a nucleotide sequence which encodes a toxin	
2	active against a non-mammalian pest wherein a portion of said nucleotide sequence can be	
3	amplified by PCR using the primer pair of SEQ ID NO. 29 and SEQ ID NO. 33.	
1	23. The isolated polynucleotide, according to claim 22, wherein said nucleotide	
2	sequence encodes a toxin of approximately 10-15 kDa.	
2	sequence encoues a toxin of approximately 10-13 kDa.	
1	24. An isolated polynucleotide comprising a nucleotide sequence which encodes a toxin	
2	active against a non-mammalian pest wherein said toxin comprises a pesticidal portion of an	
3	amino acid sequence selected from the group consisting of SEQ ID NO. 32, SEQ ID NO. 36, and	
4	SEQ ID NO. 41.	
1	25. The isolated polynucleotide, according to claim 24, wherein said toxin comprises	
2	the amino acid sequence shown in SEQ ID NO. 32.	
1	26. The isolated polynucleotide, according to claim 24, wherein said nucleotide	
2	sequence encodes a toxin of approximately 10-15 kDa.	
-	••••••••••••••••••••••••••••••••••••••	
1	27. An isolated polynucleotide comprising a nucleotide sequence which encodes a toxin	
2	active against a non-mammalian pest wherein said toxin comprises an amino acid sequence	
3	which has at least about 75% homology with an amino acid sequence selected from the group	
4	consisting of SEQ ID NO. 3, SEQ ID NO. 5, SEQ ID NO. 7, pesticidal portions of SEQ ID NO.	
5	32, pesticidal portions of SEQ ID NO. 36, and pesticidal portions of sequence IDS NO. 41.	

28. The isolated polynucleotide, according to claim 27, wherein said nucleotide sequence encodes a toxin which comprises an amino acid sequence which has at least about 80% homology with an amino acid sequence selected from the group consisting of SEQ ID NO. 3, SEQ ID NO. 5, SEQ ID NO. 7, pesticidal portions of SEQ ID NO. 32, pesticidal portions of SEQ ID NO. 36, and pesticidal portions of sequence IDS NO. 41.

29. The isolated polynucleotide, according to claim 27, wherein said nucleotide
sequence encodes a toxin which comprises an amino acid sequence which has at least about $90\%$
homology with an amino acid sequence selected from the group consisting of SEQ ID NO. 3,
SEQ ID NO. 5, SEQ ID NO. 7, pesticidal portions of SEQ ID NO. 32, pesticidal portions of SEQ
ID NO. 36, and pesticidal portions of sequence IDS NO. 41.

30. A purified toxin active against a non-mammalian pest, wherein said toxin is encoded by a nucleotide sequence which hybridizes under stringent conditions with a nucleotide sequence selected from the group consisting of: DNA which encodes SEQ ID NO. 2; DNA which encodes SEQ ID NO. 4; DNA which encodes SEQ ID NO. 6; SEQ ID NO. 8; SEQ ID NO. 10; DNA which encodes SEQ ID NO. 11; SEQ ID NO. 12; DNA which encodes SEQ ID NO. 13; SEQ ID NO. 14; DNA which encodes SEQ ID NO. 15; DNA which encodes SEQ ID NO. 16; DNA which encodes SEQ ID NO. 17; DNA which encodes SEQ ID NO. 18; DNA which encodes SEQ ID NO. 20; SEQ ID NO. 21; SEQ ID NO. 22; SEQ ID NO. 23; SEQ ID NO. 24; SEQ ID NO. 25; SEQ ID NO. 26; SEQ ID NO. 27; DNA which encodes a pesticidal portion of SEQ ID NO. 28, SEQ ID NO. 37, DNA which encodes SEQ ID NO. 38, SEQ ID NO. 42, and DNA which encodes SEQ ID NO. 43.

- The purified toxin, according to claim 30, wherein said toxin does not have the amino acid sequence shown in SEQ ID NO. 11.
- The purified toxin, according to claim 31, wherein said toxin is encoded by a nucleotide sequence which hybridizes with DNA which encodes SEQ ID NO. 2.
- The purified toxin, according to claim 31, which is encoded by DNA which hybridizes with SEQ ID NO. 10.
- 34. The purified toxin, according to claim 31, having a molecular weight of approximately 40-50 kDa.
  - 35. A purified toxin active against a non-mammalian pest, wherein said toxin immunoreacts with an antibody to an approximately 40-50 kDa toxin, or a fragment thereof, from a *Bacillus thuringiensis* isolate selected from the group consisting of PS80JI, having the

72 identifying characteristics of NRRL B-18679; PS149B1, having the identifying characteristics

of NRRL B-21553; and PS167H2, having the identifying characteristics of NRRL B-21554.

amino acid sequence shown in SEQ ID NO. 11.

36. The purified toxin, according to claim 35, wherein said toxin does not have the

37. The purified toxin, according to claim 36, having a molecular weight of about 40-50

2	kDa.
l	38. A purified toxin having activity against a non-mammalian pest, wherein said toxin
2	is encoded by a nucleotide sequence wherein a portion of said nucleotide sequence can be
3	amplified by PCR using a primer pair selected from the following group:
ı	SEQ ID NOS. 20 and 24 to produce a fragment of about 495 bp; SEQ ID NOS. 20 and
5	25 to produce a fragment of about 594 bp; SEQ ID NOS. 21 and 24 to produce a fragment of
5	about 471 bp; and SEQ ID NOS. 21 and 25 to produce a fragment of about 580 bp.
	39. The purified toxin, according to claim 38, wherein said toxin does not have the
2	amino acid sequence shown in SEQ ID NO. 11.
	40. The purified toxin, according to claim 39, having a molecular weight of about 40-50
!	kDa.
	41. A purified toxin active against a non-mammalian pest, wherein said toxin comprises
2	a pesticidal portion of the amino acid sequence shown in SEQ ID NO. 28.
l	42. The purified toxin, according to claim 41, wherein said toxin does not have the
2	amino acid sequence shown in SEQ ID NO. 11.
	43. The purified toxin, according to claim 42, wherein said toxin comprises a pesticidal
2	portion of the consensus sequence in Figure 1.
ı	44. The purified toxin, according to claim 42, having a molecular weight of
2	approximately 40-50 kDa.

- T3

  45. A purified toxin active against a non-mammalian pest, wherein said toxin comprises an amino acid sequence which has at least about 75% homology with a pesticidal portion of an amino acid sequence selected from the group consisting of SEQ ID NO. 11, SEQ ID NO. 13, SEQ ID NO. 15, SEQ ID NO. 38, and SEQ ID NO. 43.

  46. The purified toxin, according to claim 45, wherein said toxin does not have the amino acid sequence shown in SEQ ID NO. 11.

  47. The purified toxin, according to claim 46, which comprises an amino acid sequence which has at least about 80% homology with a pesticidal portion of an amino acid sequence which has at least about 80% homology with a pesticidal portion of an amino acid sequence
  - which has at least about 80% homology with a pesticidal portion of an amino acid sequence which has at least about 80% homology with a pesticidal portion of an amino acid sequence selected from the group consisting of SEQ ID NO. 11, SEQ ID NO. 13, and SEQ ID NO. 15, SEQ ID NO. 38, and SEQ ID NO. 43.
  - 48. The purified toxin, according to claim 46, which comprises an amino acid sequence which has at least about 90% homology with a pesticidal portion of an amino acid sequence selected from the group consisting of SEQ ID NO. 11, SEQ ID NO. 13, SEQ ID NO. 15, SEQ ID NO. 38, and SEQ ID NO. 43.
    - The purified toxin, according to claim 46, having a molecular weight of approximately 40-50 kDa.
  - 50. A purified toxin active against a non-mammalian pest, wherein said toxin is encoded by a nucleotide sequence which hybridizes under stringent conditions with a nucleotide sequence selected from the group consisting of: DNA which encodes SEQ ID NO. 3; DNA which encodes SEQ ID NO. 5; and DNA which encodes SEQ ID NO. 7.
  - The purified toxin, according to claim 50, having a molecular weight of approximately 10-15 kDa.
    - 52. A purified toxin active against a non-mammalian pest, wherein said toxin immunoreacts with an antibody to an approximately 10-15 kDa toxin, or a fragment thereof, from a Bacillus thuringiensis isolate selected from the group consisting of PS80JJ1, having the identifying characteristics of NRRL B-18679; PS149B1, having the identifying characteristics of NRRL B-21553; and PS167H2, having the identifying characteristics of NRRL B-21554.

74

53. The purified toxin, according to claim 52, having a molecular weight of about 10-15

54. A purified toxin having activity against a non-mammalian pest, wherein said toxin

is encoded by a nucleotide sequence wherein a portion of said nucleotide sequence can be amplified by PCR using the primer pair of SEQ ID NO. 29 and SEQ ID NO. 33.

1	55. The purified toxin, according to claim 54, having a molecular weight of about 10-15
2	kDa.
1	56. A purified toxin active against a non-mammalian pest, wherein said toxin comprises
2	a pesticidal portion of an amino acid sequence selected from the group consisting of SEQ ID
3	NO. 32, SEQ ID NO. 36, and SEQ ID NO. 41.
1	57. The purified toxin, according to claim 56, wherein said toxin comprises the amino
2	acid sequence shown in SEQ ID NO. 32.
1	58. The purified toxin, according to claim 56, having a molecular weight of
2	approximately 10-15 kDa.
1	59. A purified toxin active against a non-mammalian pest, wherein said toxin comprises
2	an amino acid sequence which has at least about 75% homology with an amino acid sequence
3	selected from the group consisting of SEQ ID NO. 3, SEQ ID NO. 5, SEQ ID NO. 7, pesticidal
4	portions of SEQ ID NO. 32, pesticidal portions of SEQ ID NO. 36, and pesticidal portions of
5	SEQ ID NO. 41.
1	60. The purified toxin, according to claim 59, which comprises an amino acid sequence
2	which has at least about 80% homology with an amino acid sequence selected from the group
3	consisting of SEQ ID NO. 3, SEQ ID NO. 5, SEQ ID NO. 7, pesticidal portions of SEQ ID NO.
4	32, pesticidal portions of SEQ ID NO. 36, and pesticidal portions of sequence IDS NO. 41.
1	61. The purified toxin, according to claim 59, which comprises an amino acid sequence
2	which has at least about 90% homology with an amino acid sequence selected from the group

WO 97/40162 PCT/US97/06463

consisting of SEQ ID NO. 3, SEQ ID NO. 5, SEQ ID NO. 7, pesticidal portions of SEQ ID NO. 32, pesticidal portions of SEQ ID NO. 36, and pesticidal portions of sequence IDS NO. 41.

- 62. A biologically pure culture of a Bacillus thuringiensis isolate selected from the group consisting of PS149B1, having the identifying characteristics of NRRL B-21553; and PS167H2, having the identifying characteristics of NRRL B-21554; and mutants thereof which retain pesticidal activity.
- 63. The biologically pure culture, according to claim 62, wherein said Bacillus thuringiensis isolate is PS149B1, having the identifying characteristics of NRRL B-21553.
- 64. The biologically pure culture, according to claim 62, wherein said Bacillus thuringiensis isolate is PS167H2, having the identifying characteristics of NRRL B-21554.
- 65. A composition of matter for controlling coleopterans comprising a Bacillus thuringiensis isolate selected from the group consisting of PS149B1, having the identifying characteristics of NRRL B-21553; and PS167H2, having the identifying characteristics of NRRL B-21554; and mutants thereof which retain activity against coleopterans, in association with an agricultural carrier appropriate for use in controlling coleonterans.
  - 66. A method for controlling a non-mammalian pest comprising contacting said pest with a pesticidal amount of a Bacillus thuringiensis isolate, or a toxin of said Bacillus thuringiensis isolate, wherein said isolate is selected from the group consisting of PS149B1. having the identifying characteristics of NRRL B-21553; and PS167H2, having the identifying characteristics of NRRL B-21554; and mutants thereof which retain pesticidal activity.
  - 67. The method, according to claim 66, wherein said Bacillus thuringiensis isolate is PS149B1, having the identifying characteristics of NRRL B-21553.
  - 68. The method, according to claim 66, wherein said Bacillus thuringiensis isolate is PS167H2, having the identifying characteristics of NRRL B-21554.

PCT/US97/06463

69. A method for controlling a non-mammalian pest which comprises contacting said pest with a pesticidal amount of a Bacillus thuringiensis toxin wherein said toxin has a characteristic selected from the group consisting of:

- (a) said toxin is encoded by a nucleotide sequence which hybridizes under stringent conditions with a nucleotide sequence selected from the group consisting of: DNA which encodes SEQ ID NO. 2, DNA which encodes SEQ ID NO. 4, DNA which encodes SEQ ID NO. 6, SEQ ID NO. 8, SEQ ID NO. 10, DNA which encodes SEQ ID NO. 11, SEQ ID NO. 12, DNA which encodes SEQ ID NO. 13, SEQ ID NO. 14, DNA which encodes SEQ ID NO. 15, DNA which encodes SEQ ID NO. 16, DNA which encodes SEQ ID NO. 17, DNA which encodes SEQ ID NO. 18, DNA which encodes SEQ ID NO. 19, SEQ ID NO. 20, SEQ ID NO. 21, SEQ ID NO. 22, SEQ ID NO. 23, SEQ ID NO. 24, SEQ ID NO. 25, SEQ ID NO. 26, SEQ ID NO. 27, DNA which encodes a pesticidal portion of SEQ ID NO. 28, SEQ ID NO. 37, DNA which encodes SEQ ID NO. 38, SEQ ID NO. 25, and DNA which encodes SEQ ID NO. 38, SEQ ID NO. 24, and DNA which encodes SEQ ID NO. 33, and wherein said toxin does not have the amino acid sequence shown in SEQ ID NO. 11;
- (b) said toxin immunoreacts with an antibody to an approximately 40-50 kDa pesticidal toxin, or a fragment thereof, from a Bacillus thuringiensis isolate selected from the group consisting of PS80JII having the identifying characteristics of NRRL B-18679, PS149B1 having the identifying characteristics of NRRL B-21553, and PS167H2 having the identifying characteristics of NRRL B-21554, and wherein said toxin does not have the amino acid sequence shown in SEQ ID NO. 11;
- (c) said toxin is encoded by a nucleotide sequence wherein a portion of said nucleotide sequence can be amplified by PCR using a primer pair selected from the group consisting of SEQ ID NOS. 20 and 24 to produce a fragment of about 495 bp, SEQ ID NOS. 20 and 25 to produce a fragment of about 594 bp, SEQ ID NOS. 21 and 24 to produce a fragment of about 471 bp, and SEQ ID NOS. 21 and 25 to produce a fragment of about 471 bp, and seq ID NOS. 21 and 25 to produce a fragment of about 580 bp, and wherein said toxin does not have the amino acid sequence shown in SEQ ID NO. 11;
- (d) said toxin comprises a pesticidal portion of the amino acid sequence shown in SEQ ID NO. 28, and wherein said toxin does not have the amino acid sequence shown in SEQ ID NO. 11;

WO 97/40162 PCT/US97/06463

		11
34	(e)	said toxin comprises an amino acid sequence which has at least about 75%
35		homology with an amino acid sequence selected from the group consisting of
36		SEQ ID NO. 11, SEQ ID NO. 13, SEQ ID NO. 15, SEQ ID NO. 38, and SEQ
37		ID NO. 43; and wherein said toxin does not have the amino acid sequence
38		shown in SEQ ID NO. 11;
39	(f)	said toxin is encoded by a nucleotide sequence which hybridizes under stringent
40		conditions with a nucleotide sequence selected from the group consisting of
41		DNA which encodes SEQ ID NO. 3, DNA which encodes SEQ ID NO. 5, and
42		DNA which encodes SEQ ID NO. 7;
43	(g)	said toxin immunoreacts with an antibody to an approximately 10-15 kDa
44		pesticidal toxin, or a fragment thereof, from a Bacillus thuringiensis isolate
45		selected from the group consisting of PS80JJ1 having the identifying
46		characteristics of NRRL B-18679, PS149B1 having the identifying
47		characteristics of NRRL B-21553, and PS167H2 having the identifying
48		characteristics of NRRL B-21554;
49	(h)	said toxin is encoded by a nucleotide sequence wherein a portion of said
50		nucleotide sequence can be amplified by PCR using the primer pair of SEQ ID
51		NO. 29 and SEQ ID NO. 33;
52	(i)	said toxin comprises a pesticidal portion of an amino acid sequence selected
53		from the group consisting of SEQ ID NO. 32, SEQ ID NO. 36, and SEQ ID NO.
54		41; and
55	(j)	said toxin comprises an amino acid sequence which has at least about 75%
56		homology with an amino acid sequence selected from the group consisting of
57		SEQ ID NO. 3, SEQ ID NO. 5, SEQ ID NO. 7, pesticidal portions of SEQ ID
58		NO. 32, pesticidal portions of SEQ ID NO. 36, and pesticidal portions of
59		sequence IDS NO. 41.
1	70. T	the method, according to claim 69, wherein the full length of said toxin is
2		40.501/D-

71. The method, according to claim 69, wherein said toxin is encoded by a nucleotide sequence which hybridizes under stringent conditions with a nucleotide sequence selected from the group consisting of: DNA which encodes SEQ ID NO. 2, DNA which encodes SEQ ID NO. 4, DNA which encodes SEQ ID NO. 6, SEQ ID NO. 8, SEQ ID NO. 10, DNA which encodes

- SEQ ID NO. 11, SEQ ID NO. 12, DNA which encodes SEQ ID NO. 13, SEQ ID NO. 14, DNA which encodes SEQ ID NO. 15, DNA which encodes SEQ ID NO. 16, DNA which encodes SEQ ID NO. 17, DNA which encodes SEQ ID NO. 18, DNA which encodes SEQ ID NO. 19, SEQ ID NO. 20, SEQ ID NO. 21, SEQ ID NO. 22, SEQ ID NO. 24, SEQ ID NO. 25, SEQ ID NO. 27, DNA which encodes a pesticidal portion of SEQ ID NO. 28, SEQ ID NO. 37, DNA which encodes a pesticidal portion of SEQ ID NO. 28, SEQ ID NO. 37, DNA which encodes SEQ ID NO. 38, SEQ ID NO. 42, and DNA which encodes SEQ ID NO. 43; and wherein said toxin does not have the amino acid sequence shown in SEQ ID NO. 11.
  - 72. The method, according to claim 69, wherein said toxin immunoreacts with an antibody to an approximately 40-50 kDa pesticidal toxin, or a fragment thereof, from a Bacillus thuringiensis isolate selected from the group consisting of PS80JJI having the identifying characteristics of NRRL B-18679, PS149B1 having the identifying characteristics of NRRL B-21553, and PS167H2 having the identifying characteristics of NRRL B-21554, and wherein said toxin does not have the amino acid sequence shown in SEO ID NO. 11.
  - 73. The method, according to claim 69, wherein said toxin is encoded by a nucleotide sequence wherein a portion of said nucleotide sequence can be amplified by PCR using a primer pair selected from the group consisting of SEQ ID NOS. 20 and 24 to produce a fragment of about 495 bp, SEQ ID NOS. 20 and 25 to produce a fragment of about 594 bp, SEQ ID NOS. 21 and 25 to produce a fragment of about 590 bp, and wherein said toxin does not have the amino acid sequence shown in SEO ID NO. 11.
  - 74. The method, according to claim 69, wherein said toxin comprises a pesticidal portion of the amino acid sequence shown in SEQ ID NO. 28, and wherein said toxin does not have the amino acid sequence shown in SEO ID NO. 11.
  - 75. The method, according to claim 69, wherein said toxin comprises an amino acid sequence which has at least about 75% homology with an amino acid sequence selected from the group consisting of SEQ ID NO. 11, SEQ ID NO. 13, SEQ ID NO. 15, SEQ ID NO. 38, and SEQ ID NO. 43; and wherein said toxin does not have the amino acid sequence shown in SEQ ID NO. 11.

1	76. The method, according to claim 69, wherein the full length of said toxin is
2	approximately 10-15 kDa.
1	77. The method, according to claim 69, wherein said toxin is encoded by a nucleotide
2	sequence which hybridizes under stringent conditions with a nucleotide sequence selected from
3	the group consisting of DNA which encodes SEQ ID NO. 3, DNA which encodes SEQ ID NO.
4	5, and DNA which encodes SEQ ID NO. 7.
1	78. The method, according to claim 69, wherein said toxin immunoreacts with an
2	antibody to an approximately 10-15 kDa pesticidal toxin, or a fragment thereof, from a Bacillus
3	thuringiensis isolate selected from the group consisting of PS80JJ1 having the identifying
4	characteristics of NRRL B-18679, PS149B1 having the identifying characteristics of NRRL B-
5	21553, and PS167H2 having the identifying characteristics of NRRL B-21554
1	79. The method, according to claim 69, wherein said toxin is encoded by a nucleotide
2	sequence wherein a portion of said nucleotide sequence can be amplified by PCR using the
3	primer pair of SEQ ID NO. 29 and SEQ ID NO. 33.
1	80. The method, according to claim 69, wherein said toxin comprises a pesticidal
2	portion of an amino acid sequence selected from the group consisting of SEQ ID NO. 32, SEQ
3	ID NO. 36, and SEQ ID NO. 41.
1	81. The method, according to claim 69, wherein said toxin comprises an amino acid
2	sequence which has at least about 75% homology with an amino acid sequence selected from
3	the group consisting of SEQ ID NO. 3, SEQ ID NO. 5, SEQ ID NO. 7, pesticidal portions of
4	SEQ ID NO. 32, pesticidal portions of SEQ ID NO. 36, and pesticidal portions of sequence IDS
5	NO. 41.
1	82. The method, according to claim 69, wherein said pest is an insect.
1	83. The method, according to claim 82, wherein said insect is a coleopteran.
1	84. The method, according to claim 82, wherein said insect is a lepidopteran.

	•
	•
2	
	sequence which has at least about 75% homology with a pesticidal portion of an amino acid
3	sequence selected from the group consisting of SEQ ID NO. 11, SEQ ID NO. 13, SEQ ID NO.
4	15, SEQ ID NO. 38, and SEQ ID NO. 43.
1	90. The method, according to claim 69, wherein said toxin comprises an amino acid
2	sequence which has at least about 90% homology with a pesticidal portion of an amino acid
3	sequence selected from the group consisting of SEQ ID NO. 11, SEQ ID NO. 13, SEQ ID NO.
4	15, SEQ ID NO. 38, and SEQ ID NO. 43.
1	91. The method, according to claim 69, wherein said toxin comprises the consensus
2	sequence shown in Figure 1.
1	92. The method, according to claim 69, wherein said toxin comprises an amino acid
2	sequence which has at least about 75% homology with an amino acid sequence selected from
3	the group consisting of SEQ ID NO. 3, SEQ ID NO. 5, SEQ ID NO. 7, pesticidal portions of
4	SEQ ID NO. 32, pesticidal portions of SEQ ID NO. 36, and pesticidal portions of sequence IDS
5	NO. 41.
1	93. The method, according to claim 69, wherein said toxin comprises an amino acid
2	sequence which has at least about 90% homology with an amino acid sequence selected from
	•

the group consisting of SEQ ID NO. 3, SEQ ID NO. 5, SEQ ID NO. 7, pesticidal portions of SEQ ID NO. 32, pesticidal portions of SEQ ID NO. 36, and pesticidal portions of sequence IDS NO. 41.

94. A method for controlling a non-mammalian pest wherein said method comprises contacting said pest with a first toxin wherein said toxin has a characteristic selected from the group consisting of:

- (a) said toxin is encoded by a nucleotide sequence which hybridizes under stringent conditions with a nucleotide sequence selected from the group consisting of: DNA which encodes SEQ ID NO. 2, DNA which encodes SEQ ID NO. 4, DNA which encodes SEQ ID NO. 6, SEQ ID NO. 8, SEQ ID NO. 10, DNA which encodes SEQ ID NO. 11, SEQ ID NO. 12, DNA which encodes SEQ ID NO. 13, SEQ ID NO. 14, DNA which encodes SEQ ID NO. 15, DNA which encodes SEQ ID NO. 16, DNA which encodes SEQ ID NO. 17, DNA which encodes SEQ ID NO. 18, DNA which encodes SEQ ID NO. 19, SEQ ID NO. 20, SEQ ID NO. 21, SEQ ID NO. 22, SEQ ID NO. 23, SEQ ID NO. 24, SEQ ID NO. 25, SEQ ID NO. 26, SEQ ID NO. 27, DNA which encodes SEQ ID NO. 38, SEQ ID NO. 28, SEQ ID NO. 37, DNA which encodes SEQ ID NO. 38, SEQ ID NO. 42, and DNA which encodes SEQ ID NO. 43; and wherein said toxin does not have the amino acid sequence shown in SEO ID NO. 11:
- (b) said toxin immunoreacts with an antibody to an approximately 40-50 kDa pesticidal toxin, or a fragment thereof, from a Bacillus thuringiensis isolate selected from the group consisting of PS80JII having the identifying characteristics of NRRL B-21859, PS149B1 having the identifying characteristics of NRRL B-21853, and PS167H2 having the identifying characteristics of NRRL B-21854, and wherein said toxin does not have the amino acid sequence shown in SEO ID NO. 11:
- (c) said toxin is encoded by a nucleotide sequence wherein a portion of said nucleotide sequence can be amplified by PCR using a primer pair selected from the group consisting of SEQ ID NOS. 20 and 24 to produce a fragment of about 495 bp, SEQ ID NOS. 20 and 25 to produce a fragment of about 594 bp, SEQ ID NOS. 21 and 24 to produce a fragment of about 471 bp, and SEQ ID NOS. 21 and 25 to produce a fragment of about 580 bp, and wherein said toxin does not have the amino acid sequence shown in SEQ ID NO. 11:

31	(d)	said toxin comprises a pesticidal portion of the amino acid sequence shown in
32		SEQ ID NO. 28, and wherein said toxin does not have the amino acid sequence
33		shown in SEQ ID NO. 11;
34	(e)	said toxin comprises an amino acid sequence which has at least about 75%
35		homology with a pesticidal portion of an amino acid sequence selected from the
36		group consisting of SEQ ID NO. 11, SEQ ID NO. 13, SEQ ID NO. 15, SEQ ID
37		NO. 38, and SEQ ID NO. 43; and wherein said toxin does not have the amino
38		acid sequence shown in SEQ ID NO. 11;
39	and further con	nprising contacting said pest with a second toxin having a characteristic selected
40	from the group	consisting of:
41	(f)	said toxin is encoded by a nucleotide sequence which hybridizes under stringent
42		conditions with a nucleotide sequence selected from the group consisting of
43		DNA which encodes SEQ ID NO. 3, DNA which encodes SEQ ID NO. 5, and
44		DNA which encodes SEQ ID NO. 7;
45	(g)	said toxin immunoreacts with an antibody to an approximately 10-15 kDa
46		pesticidal toxin, or a fragment thereof, from a Bacillus thuringiensis isolate
47		selected from the group consisting of PS80JJ1 having the identifying
48		characteristics of NRRL B-18679, PS149B1 having the identifying
49		characteristics of NRRL B-21553, and PS167H2 having the identifying
50		characteristics of NRRL B-21554;
51	(h)	said toxin is encoded by a nucleotide sequence wherein a portion of said
52		nucleotide sequence can be amplified by PCR using the primer pair of SEQ 1D
53		NO. 29 and SEQ ID NO. 33;
54	(i)	said toxin comprises a pesticidal portion of an amino acid sequence selected
55		from the group SEQ ID NO. 32, SEQ ID NO. 36, and SEQ ID NO. 41; and
56	<b>(j)</b>	said toxin comprises an amino acid sequence which has at least about 75%
57		homology with an amino acid sequence selected from the group consisting of
58		SEQ ID NO. 3, SEQ ID NO. 5, SEQ ID NO. 7, pesticidal portions of SEQ ID
59		NO. 32, pesticidal portions of SEQ ID NO. 36, and pesticidal portions of

95. The process, according to claim 94, wherein said pest is selected from the group consisting of insects and mites.

sequence IDS NO. 41.

60

- 96. The process, according to claim 95, wherein said pest is a coleopteran.
- 97. The process, according to claim 94, wherein said first toxin has a full length of about 40-50 kDa and said second toxin has a full length of about 10-15 kDa.
- 98. A recombinant host transformed to express a toxin having activity against a non-mammalian pest wherein said toxin has at least one characteristic selected from the group consisting of:
  - (a) said toxin is encoded by a nucleotide sequence which hybridizes under stringent conditions with a nucleotide sequence selected from the group consisting of: DNA which encodes SEQ ID NO. 2, DNA which encodes SEQ ID NO. 4, DNA which encodes SEQ ID NO. 6, SEQ ID NO. 8, SEQ ID NO. 10, DNA which encodes SEQ ID NO. 11, SEQ ID NO. 12, DNA which encodes SEQ ID NO. 13, SEQ ID NO. 14, DNA which encodes SEQ ID NO. 15, DNA which encodes SEQ ID NO. 16, DNA which encodes SEQ ID NO. 16, DNA which encodes SEQ ID NO. 17, DNA which encodes SEQ ID NO. 18, DNA which encodes SEQ ID NO. 19, SEQ ID NO. 20, SEQ ID NO. 21, SEQ ID NO. 22, SEQ ID NO. 23, SEQ ID NO. 25, SEQ ID NO. 26, SEQ ID NO. 27, DNA which encodes a pesticidal portion of SEQ ID NO. 28, SEQ ID NO. 37, DNA which encodes SEQ ID NO. 38, SEQ ID NO. 42, and DNA which encodes SEQ ID NO. 43; and wherein said toxin does not have the amino acid sequence shown in SEQ ID NO. 11, 11
    - (b) said toxin immunoreacts with an antibody to an approximately 40-50 kDa pesticidal toxin, or a fragment thereof, from a Bacillus thuringiensis isolate selected from the group consisting of PS80JII having the identifying characteristics of NRRL B-18679, PS149B1 having the identifying characteristics of NRRL B-21553, and PS167H2 having the identifying characteristics of NRRL B-21554, and wherein said toxin does not have the amino acid sequence shown in SEQ ID NO. 11:
    - (c) said toxin is encoded by a nucleotide sequence wherein a portion of said nucleotide sequence can be amplified by PCR using a primer pair selected from the group consisting of SEQ ID NOS. 20 and 24 to produce a fragment of about 495 bp, SEQ ID NOS. 20 and 25 to produce a fragment of about 594 bp, SEQ ID NOS. 21 and 24 to produce a fragment of about 471 bp, and SEQ ID NOS.

PCT/US97/06463

84

29		21 and 25 to produce a fragment of about 580 bp, and wherein said toxin does
30		not have the amino acid sequence shown in SEQ ID NO. 11;
31	(d)	said toxin comprises a pesticidal portion of the amino acid sequence shown in
32		SEQ ID NO. 28, and wherein said toxin does not have the amino acid sequence
33		shown in SEQ ID NO. 11;
34	(e)	said toxin comprises an amino acid sequence which has at least about $75\%$
35		homology with a pesticidal portion of an amino acid sequence selected from the
36		group consisting of SEQ ID NO. 11, SEQ ID NO. 13, SEQ ID NO. 15, SEQ ID
37		NO. 38, and SEQ ID NO. 43; and wherein said toxin does not have the amino
38		acid sequence shown in SEQ ID NO. 11;
39	(f)	said toxin is encoded by a nucleotide sequence which hybridizes under stringent
40		conditions with a nucleotide sequence selected from the group consisting of
41		DNA which encodes SEQ ID NO. 3, DNA which encodes SEQ ID NO. 5, and
42		DNA which encodes SEQ ID NO. 7;
43	(g)	said toxin immunoreacts with an antibody to an approximately 10-15 kDa
44		pesticidal toxin, or a fragment thereof, from a Bacillus thuringiensis isolate
45		selected from the group consisting of PS80JJ1 having the identifying
46		characteristics of NRRL B-18679, PS149B1 having the identifying
47		characteristics of NRRL B-21553, and PS167H2 having the identifying
48		characteristics of NRRL B-21554;
49	(h)	said toxin is encoded by a nucleotide sequence wherein a portion of said
50		nucleotide sequence can be amplified by PCR using the primer pair of SEQ ID
51		NO. 29 and SEQ ID NO. 33;
52	(i)	said toxin comprises a pesticidal portion of an amino acid sequence selected
53		from the group consisting of SEQ ID NO. 32, SEQ ID NO. 36, and SEQ ID NO.
54		41; and
55	(j)	said toxin comprises an amino acid sequence which has at least about $75\%$
56		homology with an amino acid sequence selected from the group consisting of
57		SEQ ID NO. 3, SEQ ID NO. 5, SEQ ID NO. 7, pesticidal portions of SEQ ID
58		NO. 32, pesticidal portions of SEQ ID NO. 36, and pesticidal portions of
59		sequence IDS NO. 41.

99. The recombinant host, according to claim 98, wherein said host expresses a first toxin which has a characteristic selected from the group consisting of:

J	(a)	said toxin is chedded by a nucleotide sequence which hybridizes under stringent
4		conditions with a nucleotide sequence selected from the group consisting of
5		DNA which encodes SEQ ID NO. 2, DNA which encodes SEQ ID NO. 4, DNA
6		which encodes SEQ ID NO. 6, SEQ ID NO. 8, SEQ ID NO. 10, DNA which
7		encodes SEQ ID NO. 11, SEQ ID NO. 12, DNA which encodes SEQ ID NO.
8		13, SEQ ID NO. 14, DNA which encodes SEQ ID NO. 15, DNA which encodes
9		SEQ ID NO. 16, DNA which encodes SEQ ID NO. 17, DNA which encodes
10		SEQ ID NO. 18, DNA which encodes SEQ ID NO. 19, SEQ ID NO. 20, SEQ
11		ID NO. 21, SEQ ID NO. 22, SEQ ID NO. 23, SEQ ID NO. 24, SEQ ID NO. 25,
12		SEQ ID NO. 26, SEQ ID NO. 27, DNA which encodes a pesticidal portion of
13		SEQ ID NO. 28, SEQ ID NO. 39, DNA which encodes SEQ ID NO. 38, SEQ
14		ID NO. 42, and DNA which encodes SEQ ID NO. 43; and wherein said toxin
15		does not have the amino acid sequence shown in SEQ ID NO. 11;
16	(b)	said toxin immunoreacts with an antibody to an approximately 40-50 kDa
17		pesticidal toxin, or a fragment thereof, from a Bacillus thuringiensis isolate
18		selected from the group consisting of PS80JJ1 having the identifying
19		characteristics of NRRL B-18679, PS149B1 having the identifying
20		characteristics of NRRL B-21553, and PS167H2 having the identifying
21		characteristics of NRRL B-21554, and wherein said toxin does not have the
22		amino acid sequence shown in SEQ ID NO. 11;
23	(c)	said toxin is encoded by a nucleotide sequence wherein a portion of said
24		nucleotide sequence can be amplified by PCR using a primer pair selected from
25		the group consisting of SEQ ID NOS. 20 and 24 to produce a fragment of about
26		495 bp, SEQ ID NOS. 20 and 25 to produce a fragment of about 594 bp, SEQ
27		ID NOS. 21 and 24 to produce a fragment of about 471 bp, and SEQ ID NOS.
28		21 and 25 to produce a fragment of about 580 bp, and wherein said toxin does
29		not have the amino acid sequence shown in SEQ ID NO. 11;
30	(d)	said toxin comprises a pesticidal portion of the amino acid sequence shown in
31		SEQ ID NO. 28, and wherein said toxin does not have the amino acid sequence
32		shown in SEQ ID NO. 11; and
33	(e)	said toxin comprises an amino acid sequence which has at least about 75%
34		homology with an amino acid sequence selected from the group consisting of
35		SEQ ID NO. 11, SEQ ID NO. 13, SEQ ID NO. 15, SEQ ID NO. 38, and SEQ

PCT/US97/06463

86

36		ID NO. 43; and wherein said toxin does not have the amino acid sequence
37		shown in SEQ ID NO. 11;
38	and said host e	xpresses a second toxin having a characteristic selected from the group consisting
39	of:	
40	(f)	said toxin is encoded by a nucleotide sequence which hybridizes under stringent
41		conditions with a nucleotide sequence selected from the group consisting of
42		DNA which encodes SEQ ID NO. 3, DNA which encodes SEQ ID NO. 5, and
43		DNA which encodes SEQ ID NO. 7;
44	(g)	said toxin immunoreacts with an antibody to an approximately 10-15 kDa
45		pesticidal toxin, or a fragment thereof, from a Bacillus thuringiensis isolate
46		selected from the group consisting of PS80JJ1 having the identifying
47		characteristics of NRRL B-18679, PS149B1 having the identifying
48		characteristics of NRRL B-21553, and PS167H2 having the identifying
49		characteristics of NRRL B-21554;
50	(h)	said toxin is encoded by a nucleotide sequence wherein a portion of said
51		nucleotide sequence can be amplified by PCR using the primer pair of SEQ ID
52		NO. 29 and SEQ ID NO. 33;
53	(i)	said toxin comprises a pesticidal portion of an amino acid sequence selected
54		from the group consisting of SEQ ID NO. 32, SEQ ID NO. 36, and SEQ ID NO.
55		41; and
56	<b>(j)</b>	said toxin comprises an amino acid sequence which has at least about 75%
57		homology with an amino acid sequence selected from the group consisting of
58		SEQ ID NO. 3, SEQ ID NO. 5, SEQ ID NO. 7, pesticidal portions of SEQ ID
59		NO. 32, pesticidal portions of SEQ ID NO. 36, and pesticidal portions of
60		sequence IDS NO. 41.
1	100.	The recombinant host, according to claim 98, wherein said host is selected from
2	the group cons	sisting of plants, yeasts, and bacteria.
1	101.	The isolated polynucleotide, according to claim 1, wherein said nucleotide
2	sequence hybr	ridizes with SEQ ID NO. 37.
1	102.	The isolated polynucleotide, according to claim 1, wherein said nucleotide

sequence hybridizes with SEQ ID NO. 42.

hybridizes with SEQ ID NO. 37.

hybridizes with SEQ ID NO. 42.

the amino acid sequence shown in SEQ ID NO. 36.

103. The purified toxin, according to claim 31, which is encoded by DNA which

104. The purified toxin, according to claim 31, which is encoded by DNA which

105. The isolated polynucleotide, according to claim 24, wherein said toxin comprises

l	106. The isolated polynucleotide, according to claim 24, wherein said toxin comprises
2	the amino acid sequence shown in SEQ ID NO. 41.
l	107. The purified toxin, according to claim 56, wherein said toxin comprises the amino
2	acid sequence shown in SEQ ID NO. 36.
1	108. The purified toxin, according to claim 56, wherein said toxin comprises the amino
2	acid sequence shown in SEQ ID NO. 41.
1	109. An isolated polynucleotide comprising a nucleotide sequence which encodes an
2	approximately 10-15 kDa 80JJ1 toxin active against non-mammaliian pests, wherein said
3	nucleotide sequence has been optimized for expression in plants.
1	110. The isolated polynucleotide, according to claim 109, wherein said polynucleotide
2	comprises the sequence shown in SEQ ID NO. 44.
1	111. An isolated polynucleotide comprising a nucleotide sequence which encodes an
2	approximately 40-50 kDa 80JJ1 toxin active against non-mammalian pests, wherein said
3	nucleotide sequence has been optimized for expression in plants.
1	112. The isolated polynucleotide, according to claim 111, wherein said polynucleotide
2	comprises the sequence shown in SEQ ID NO. 45.
